It is CB that is the "hobby". Ham radio is a technical pursuit,
a whole-life pre-occupation.

Technology changes, but it is still the essence of Radio Hams to
remain interested in and be motivated by technology.

Well, maybe not a "prelude" but one of our local M3s (now an M0 one, of the
many that have moved through the system) built a Wimshurst Machine and some
other such beasts.

Still waiting on the RSGB publishing those figures to prove that....=20
Anything else is just pure speculation and conjecture.

--=20
ARRL membership =3D $39 (~=A320)

RSGB membership =3D =A344

Don't let them rip you off any more.
Do the right thing, resign from the RSGB today.

The RSGB said Radio Amateurs were a threat to national security!
Is this the type of organisation you want to represent you?

Few in here were around when the "phono oscillator" was a
consumer electronics product...in the 1940s. :-)

Back then there were few "radios" (AM broadcast receivers)
that had any audio input jack on the back and "records"
(78 RPM discs) were the new thing for the home.
Phonographs (self-contained units) sometimes had such
oscillators...usually one-tube AM oscillators that could be
set to an unoccupied spot on the AM BC band. No wires
to connect! :-)

These were neat little projects for the teener back then,
letting them play grown-up "broadcaster." I was one of
those for a few days back then...until my Dad, coming
home from work, saw my buddy carrying my portable
receiver and listening to my voice coming out of it...:-)

Not a technically-difficult task to build one, even very
low-power. Today's wireless FM microphone is more
complex, although not too much. With transistors or
ICs, an AM wireless mike can be made, with battery
supply, in most any large microphone enclosure. No
mike cable needed.

It's USE is a fad, little more. The FM mike in a Karaoke
setup is much more entertaining in a party environment.
These "AM broadcast" thingies are good as minor profit

devices for kit makers but very limited due to today's
[USA] Part 15 limitations.

Evans, knock it off with this crossposting of pretentious
blabbering. Try confining it to uk.radio.amateur or maybe
rec.radio.amateur.misc. It doesn't belong in HOMEBREW
since it is nothing but YOUR OPINION...an opinion which
"we" have all heard for years with little variance in oratory.

If you are "serious" about this "FAQ" then go to the new
rec.radio.amateur.moderated and post. If you dare. :-(

Only in your mind since you choose to view it that way. There are many fine
CB operators. However the service has been trashed by the noticeable few.
All must then suffer the insults engendered by the few.

I know why the inductor is usually necessary. The thing is that for the purpose of the Butler the effect of C0 can be neutralized.
The question is whether it can be made to have a similar effect in the "pulling arena" as well. Of course it should not have to much side effects in normal operation of the oscillator.

In the overtone butler there is also another LC resonance circuit present that determines the possible operating frequency (read desired overtone). Such a thing might be necessary in most circuits where an inductor is placed in parallel with a crystal.

These are interesting experiments, though if I wanted a high voltage diode
from a microwave oven, I would be tempted to take the small one made from
silicon instead.

What is the advantage over using several secondary windings, each with its
own rectifier made from 1N4007 (or better) diodes, and then connecting the
DC outputs from the rectifiers in series?

(or the standard old technique of using several 1kV diodes in series, with a
capacitor and resistor in parallel with each diode, to keep the voltage
sharing even)

Chris

Your "standard neon bulb rated at 125 VAC" probably contains a series resistor of maybe 100kOhms, and so will be not much use for protecting anything, because any current would develop too much voltage across the series resistor. If you open it up and remove the resistor then it will be able to shunt larger currents, though it still may not be ideal for protecting receivers. (The main advantage of the neon as a protection device is very low capacitance which could be important on the higher frequency bands, but another advantage would be that it would introduce practically no intermodulation even in very strong signal conditions, but the breakdown voltage is probably so high that it may not protect solid - state receivers very well, as someone else already mentioned. You can buy a ceramic cased gas discharge surge arrestor, they are popular for telephone circuits. e.g.:
http://www.epcos.com/inf/100/ds/ec350xx0810.pdf
)

You can probably make the bare neon bulb flicker by charging up something with static electricity (e.g. rub a balloon on your head or on a jumper) and then hold this near the bulb so you can hear crackling.

============================

Your expoxy embedded diode block is highly likely containing some 1000 V
PIV silicon diodes wired in series.
Suggest ,with a low voltage power supply, you allow 20 - 30 mA
(forward bias) current to flow through the block.
With the knowledge that the voltage across each silicon diode is approx
0.7 V you measure the voltage across the block ,and then can
determine the number of diodes and hence the overall PIV. The max AC
rms voltage to be rectified should be less than 35 percent of that
PIV, being 70 percent of half the PIV

The max current the block can accept can be ESTIMATED in 2 ways.
Allow a DC current to to flow such that after a while the block is
'hand warm' , alternatively the current at which the voltage across
the block has increased by 30 percent compared with the voltage across
the block at a current of 20 -30 mA

I agree the above methods do not constitute a very scientific approach
,yet they provide useful info for practical purposes.

I have done the same with some 'mystery' HV diodes and so far ....so good.

Suggest you test/verify the above method(s) with a HV diode from a
microwave oven with a known capacity .If not known ,the HV voltage of
the relevant transformer can be calculated (if not measured directly)
by connecting the primary winding to a low voltage (10 -15 V) and
measuring the voltage across the secondary.

Hey Chris,

Thanks for the input. I am wondering why a neon bulb would include a 100K resistor... To maybe lessen the current being driven through the bulb? I'm going to have to check that out. Still, I am thinking that a couple of back-to-back diodes each with a 100K resistor in series would probably do what I want. Going to try my hand at building a test-bed and give it a shot. Will check out the gas discdharge surge arrestor though. Sounds much simpler, and likely more reliable.

Appreciate your feeback.

Dave

Try using a Motorola Peizo Tweeter. I think some are spec'd into
ultrasonic range.

The neon lamp works the same as a gas voltage
regulator--about 80 volts or so IIRC...
The resistor serves to limit the current.

Hello Pete,

I was actually thinking something similar, that the diodes would prevent any current from flowing through the circuit so long as the voltage remained on the small-signal level. And if a large pulse did come through, the inductance of the resistors would be the least of my worries. Any interferrance it caused in my receiver would be brief and likely go unnoticed. Does this sound plausible, or at least somewhat predictive of likely real-life events in the case of a static charge coming down the line?

Dave

You are missing the point........ :-)

Why would someone use a large heavy piece of equipment weighing up to several hundred pounds with several large heat generating glass things in them, several large metal cubes in them, with operating voltages ranging up to a thousand volts..... When they could use a little light square box, about the size of two bricks, with a fancy display, that runs off of an almost harmless 12V DC, and will do the exact same thing?

Because they want to!!!!!!!

Magnetron tubes are too neat looking to throw away, or leave unused.

I think that a set of magnetron tubes that have been removed from the cases, and set on a set of ceramic standoffs would have definite cool appeal in a HV power supply.

I wonder what the internal electrode to electrode breakdown voltage would be? That would be the PRV operating limit if you took a magnetron tube and put it in a one gallon paint bucket filled with mineral oil. It wouldn't have a problem with arcing over on the outside in that setup. Wouldn't need cooling fins on the tube any more, and you could put the filament transformer in the bucket with the magnetron. all you would have coming out of the bucket is the AC line running the transformer, and the two HV feedthroughs for the HV connections to the magnetron.

I think that the diodes with resistors in series will probably not be ideal.

If you want to just discharge small steady currents of static electricity being picked up by your antenna then all you need is a 100k (or 10k) resistor from the antenna to ground.

If you want to protect against voltage spikes (e.g. caused by distant lightning), (practically nothing will stop direct lightning) then your diodes, connected in parallel, and one pointing in each direction, will offer some protection, but in that case you must leave out the series resistors because the series resistors will stop the diodes from performing any useful function. If you are likely to experience strong radio signals that could produce more than 0.2V on your antenna (and I would guess that the answer is likely to be yes), then maybe the diodes will introduce intermodulation (a form of interference) into your signal. In this case, a number of diodes in series, in each direction, will allow larger RF signals to pass without excessive distortion.

```
   \|/
    |  Antenna
    |
    *-----\/\/\/\------.  100k resistor
    |                  |
    *--|>|--|>|--|>|---*  3x diodes, one direction
    |                  |
    *---|<|--|<|--|<|--*  3x diodes, other direction
    |                  |
    '--||--To Rx      ___ Earth
      Cap              _
                       .
```

For very high frequencies, small diodes such as 1N4148 may be needed, though for lower frequencies you may be able to get away with using larger, more robust diodes. At higher frequencies, big diodes may have too much capacitance.

This won't give all that much protection against powerful surges, so if your radio is especially valuable then a commercial protection device might be a good idea, and in any case unplugging the antenna when not in use would be sensible.

Instead of the above circuit using the diodes in parallel, you could also try using a pair of zener diodes in series, one pointing in each direction.

Chris

I was intendending to connect the diodes in parallel, such as you describe
below. Sorry for the lack of clarity...

Why would the resistors disable the diodes? I expected they would merely
limit the current through the diodes...

I am working in the HF region, 2-30 MHz.

Oh yes, I do unplug it when not in use. Definetly.

I was thinking about Zener diodes, and trying to figure how they might be
applied. My only hesitation there is the power dissipation capabilities of
Zeners, compared to standard diodes.

The so-called 125 volt neon bulb is probably a 50 volt neon bulb with a 47K to 150K resistor in series. Without the resistor it would draw too much current from the 125 volt mains and either trip a circuit breaker or destroy the NE-2 bulb, probably both.

An NE-2 bulb has a breakdown potential of approximately 50 volts (slightly more or less depending on external light conditions). If your transmitter never puts more than 50 volts on the feed line you could conceivably use this for a impulse suppression device, but bear in mind that it will not protect your receiver from voltages of less than 50 volts. Once the gas in a neon bulb reaches the breakdown point (50 volts in an NE-2) it becomes a short circuit until the voltage drops below the breakdown point.

If you are plagued by static build up on your antenna, and if your feed line normally operates at a low impedance (i.e. 50 ohms) you can use a 10K ohm 2-watt non-inductive resistor to bleed off the static build up. Do not use a wire wound resistor because it's inductance may have a negative impact on feed line SWR. If you want to prevent close-in lightning strikes from causing impulse voltage of over 50 volts you can use that NE-2, but there are better devices like the telephone protector that a previous post recommended. Many persons use a simple impulse protector that is homemade from two pointed sections of metal with one tied to your feed line and the other connected to a good earth ground. This method is documented in most ham radio antenna handbooks.

Hello! :-)

I'm interested in homebrewing. I've been a SWL since 1986, and I'm a newcomer to amateur radio, although I have been interested in that since then too, and will be getting my ticket during the course of the following year. I now own a Yaesu FT-757GX which I use as my HF Gen coverage receiver so I can still listen to SW, and practice code and then get my ticket, while working on building the rig and slowly learning still. Mind you, I also have a Fluke 8050A DMM too that I bought last year which will help me. (Still learning how to use it)

In an effort to help me learn more about electronics than I already know, not a whole lot at this point, I am going to build something with which I can use once I finally get my ticket.

In search for helpful documentation, I found a book by Randy L. Henderson, titled "Build Your Own Intelligent Amateur Radio Transceiver". While now 10 years old, the book has many outdated components, and other errors in the book. While a good design idea, I think it could be improved on to 2006/2007 standards in many ways.. which I will attempt to do. The rig is based on the 80C31 / 8051 family with a 27C64 EPROM in with a 7805 regulator, and 74LS373 on the computer board. The computer board also listed as having: a 1N4001, a 1N4148, a 2N2222A, a 2N2907, and lastly a SK3444. It also featured a 100,000uF memory backup capacitor and a 6.2v Zener.

My basic dimensions for the chassis are 16.1875" W x 6.1875" H x 15" D.. so that will be the working envelope of whatever design I end up with. That's a pretty big space, and I like having space to work inside.

Well, anyhow this is my introductory post, and I'd love to hear your comments, suggestions, etc.

Greg B.

Do a google search regarding the code requirement on ham radio, and be prepared for a surprise.

You don't need to know the code to get a ham license any more. The FCC has dropped the code requirement for all licenses. Even extra.

You can get an extra and not even know what CW is.

Best of luck.

Well, I still think it best to learn it, especially in theory.. lots of beacons, etc. use it. I have no idea why they dropped it entirely. I know about the Feb. 23rd ruling. Oh, well...

Any help with my project is greatly appreciated.

gbowne1 wrote:

>   I'm interested in homebrewing. I've been a SWL since 1986, and I'm a newcomer to amateur radio, although I have been interested in that since then too, and will be getting my ticket during the course of the following year. I now own a Yaesu FT-757GX which I use as my HF Gen coverage receiver so I can still listen to SW, and practice code and then get my ticket, while working on building the rig and slowly learning still. Mind you, I also have a Fluke 8050A DMM too that I bought last year which will help me. (Still learning how to use it)
>
>   In an effort to help me learn more about electronics than I already know, not a whole lot at this point, I am going to build something with which I can use once I finally get my ticket.
>
>   In search for helpful documentation, I found a book by Randy L. Henderson, titled
> "Build Your Own Intelligent Amateur Radio Transceiver". While now 10 years old, the book has many outdated components, and other errors in the book. While a good design idea, I think it could be improved on to 2006/2007 standards in many ways.. which I will attempt to do. The rig is based on the 80C31 / 8051 family with a 27C64 EPROM in with a 7805 regulator, and 74LS373 on the computer board. The computer board also listed as having: a 1N4001, a 1N4148, a 2N2222A, a 2N2907, and lastly a SK3444. It also featured a 100,000uF memory backup capacitor and a 6.2v Zener.
>
>   My basic dimensions for the chassis are 16.1875" W x 6.1875" H x 15" D.. so that will be the working envelope of whatever design I end up with. That's a pretty big space, and I like having space to work inside.
>
>   Well, anyhow this is my introductory post, and I'd love to hear your comments, suggestions, etc.

My catchphrase of advice: "If you don't know how to do it, you don't know how to do it with a computer".

I don't know much about the book in question and the radio it builds, but the parts you name are all computer parts, not radio parts. My gut advice would be that you not build a computer but a radio :-)

My feeling is that if you want to do something that is a mix of analog and digital to do something interesting in radio, go through the SDR ("Software-Defined Radio") route. Google "software defined radio" along with ham to see some links to stuff that's been published in QEX and other sources the past couple of years.

But I'd encourage you to also build some really, really simple regen receivers before doing anything that has a computer in it. The learning curve will be so much less steep, and you'll learn so much more about radio (as opposed to computers) by doing so.

More generically, also consider investing in the ARRL Handbook and Horowitz and Hill's _The Art of Electronics_. Neither are abstract academic texts, they are all about hands-on stuff. Together they will cost more than a good used ham rig, though they will pay off much more in the long run!

Tim.

Can I mention? -

If any of you want to go /P
Aldi is selling a generator for �50 tomorrow.

Russ

I quote-

"This smooth running suitcase type generator offers a reliable power source
in inaccessible areas.
It is ideal for any number of uses including power tools, lighting, camping
and other outdoor activities."

"Maximum output: 720 watts
Minimum output: 650 watts
2HP
Fuel tank capacity 7.5 litres
Fuel type: 50:1 petrol/oil mix
Speed: 3,000rpm
Starting system: recoil (electronic ignition)
Alternator: brushless self-exciting
Overload circuit breakers: 1 � 230V and 1 � 12V DC
AC power output: 1 � 230V socket
DC power output: 12V battery charging
Charging lead and clips included
Noise: 62dBA at 7 metres, LWA 85
Turbo frame mounted and supplied with carry handle
Front reading voltmeter
Weight 21.7kg"

Wow. Thanks for the info on how the neon bulb works. I had no idea it
became a short once the gas was ionized, but now that makes sense.

I need to check out the pointed-metal device you describe. Sounds good, but
I am really trying to build the static protection into my RF amplifier so
that it goes wherever the amplifer goes. Afraid of someone scruffing their
feet on the carpet and touching the built-in extendable antenna.

Thanks, Arv, for the informative post. Much food for thought...

Dave

I have a similar small generator, which is very handy for running power tools such as an electric drill or an angle-grinder... but switch-mode mains power supplies do NOT seem to like the waveform if they are the only load connected.

You already answered your question, Christian radio (and TV stations) can be
found throughout your part of the Bible belt. Sadly, these promoters still
don't "get the Internet and rural access" (part of this is due to alignment
'of some' that technology is bad)
IF they did -- you would not have an Internet access problem.

Yes it will limit the current through the diodes. That is the problem: the current that is not able to flow through the diodes will flow through your RX instead. It is better to remove the resistors in series with the diodes, since the current will do less harm (or less expensive harm) if it flows in the diodes instead of your RX.

You can get very high pulse power rated Zeners, designed for clamping pulses. They do not call them Zeners though, they call them something different (TVS? Transzorb?) I think these may have too much capacitance for 30MHz work.
http://www.vishay.com/diodes/protection-tvs-esd/trans-zorb/

Chris

   Back in the pre-history of most folks here (like 1940), the old
   ARC-5 Command Set Receivers for HF had little neon bulbs
   connected in parallel to the high-impedance antenna input.
   Being IN aircraft that naturally developed some static
   electricity charges on their wire antennas, the bulbs' kept
   the static charges from accumulating beyond the (approx)
   70 volt bulb breakdown.  It was a rudimentary noise
   reduction scheme back then.

   For receiving or transmitting, a simple 1:1 (or any other
   ratio) balun will both DC-ground the antenna and offer
   DC isolation between antenna and feedline.  Any static
   that tries to accumulate on the antenna is quickly
   drained away by the DC path to ground.

   A 1K to 10K half- to 2-watt resistor at a receiver antenna
   input shunted across it will serve to drain away static
   electricity charges without seriously changing the antenna
   impedance.  For a balanced antenna input (like 300 Ohm
   line common with TV and FM BC receivers), just use two
   of them with the common point to ground.

   Static electricity build-up is common on insulated long-
   wire antennas in locations with lots of thunderstorm
   activity (where I grew up in Illinois, for example).  By
   itself it could, possibly, pose a danger (certainly a very
```

rude shock). A continuous drain-away device such as
a balun (preferred) or a resistor will lessen that.

Above all - especially in thunderstorm locations - USE A
LIGHTNING ARRESTER ON ANTENNAS!

73, Len AF6AY

> advice would be that you not build a computer but a radio :-)

Tim, I don't want to sound demeaning about a "clever" response,
but, for the last 30 years or so, "radios" ARE using more and
more "computer" parts. The main frequency-determining
components of modern receivers, transmitters, transceivers in
amateur radio ARE "computer sub-systems." PLLs and DDSs
ARE "digital" and the last part of the "IF" in the newer receivers
ARE "digital." So is voice-frequency shaping and compression-
expansion and noise reduction.

"Begin with a simple regenerative receiver?" I say a resounding
NO to that. All that will be "learned" is assembly and how to
fuss around with trying to keep it from becoming a transmitter.
NOT a good place to start to "learn" despite the political-
correctness and "all the old-timers say that." Nonsense. I'm
one of those old-timers and "been there, done that, got lots
of T-shirts" in many ways in radio-electronics.

To "begin learning" I would suggest getting an ancient TUBE-
type "All American Five" AM BC receiver. There must be tens

or hundreds of thousands of those things sitting around unused in attics, basements, etc. It is a basic superheterodyne receiver with simple power supply, a local oscillator (think of it as a "VFO-to-be"), a Mixer, a gain-controlled IF amplifier, a diode detector, and a two-stage audio (low) power amplifier. All the basic building blocks in there on one chassis.

EXAMINE each stage and its interrelationships, play with changing things as clues come into mind from textbook explanations. The "signal sources" are plentiful and no signal generator is needed until the examination gets very detailed. Make a mistake fussing around with one? Not a serious problem. They can be had for nothing from neighbors or family that accumulates old stuff...for nothing usually. Get two or three if possible...old parts for them are getting scarce.

Need progress towards a transmitter? The Hartley oscillator in an All-American Five is an introduction to oscillators and modern "computer age" oscilloscopes can monitor the waveforms in it. One heckuva lot better than, for example, I had it over 50 years ago. Add a simple, low-power Class C tube amplifier (parts out of a second AM BC receiver) and one has the basic MOPA transmitter (Master Oscillator Power Amplifier). From there it is messing about with crystal controlled oscillators and various keying schemes for OOK CW and old-timer's beloved morse code. :-)

One of the VERY LAST things a beginner should avoid is to jump in with plans to build some kind of state-of-the-art digital transceiver. NOT from it being "made of computer parts" but because what happens INSIDE the "digital" devices is so enormously COMPLICATED that it can present a very steep cliff in a learning curve about "radio." Unless one has a very good theoretical grounding in MANY DIFFERENT circuits and schemes that have led up to such "digital radio" designs, the best way (to me) is to start with a KIT and learn assembling the parts. The design has already been worked out. Those few who bother going into WHY it woks can do so with something that works after assembly.

Doing what "everyone else" did some 30 to 50 years ago sounds all nice and homey but is NOT "the best" way to approach radio in this new millennium. WE are IN the "digital age" and have been for decades...but the analog circuits are still blended in. We have to know how they all interface and the characteristics of all to make a whole system work.

73, Len AF6AY

Dave

A Zener acts like a regular diode in one direction, the Zener is actually a back biased diode that is run into it's reverse breakdown point (over simplification). You could use two Zeners in SERIES to clamp an AC voltage.

I think you should start by giving us some parameters.

1. What kind of receiver are you trying to protect; tube or solid state?

2. Are there any transmitters nearby (ham or CB)?

3. What kind of antenna (long wire, dipole, etc.)

4. Urban or rural environment, nearby AM broadcast facilities?

Some other things that you might consider would be adding a sacrificial fuse in line with the protection, say when the diodes or gas arrestor clamp you could have a 47 pilot lamp wired in series with the antenna to limit the current to diodes.

Pete

I came across this item:
http://cgi.ebay.com/06-02474-Rodostub-Tuner-DC-12GHz-N-Male-Female-Stub-RF_W0QQitemZ180020464744QQcategoryZ1504QQssPageNameZWDVWQQrdZ1QQcmdZViewItem?hash=item180020464744
while looking for double-slug tuners (anyway have one they want to sell? :-)) and it's not at all clear to me what it does. Does it just provide a few degrees of "line stretching" as you rotate it to provide fine tuning of a match? Or something else?

I did some Googling by Teledyne is notoroius difficult to get useful information from!

Thanks,
---Joel

Thanks for some great idea. I don't have access to a hi-pot and these
approaches make a lot of sense. I have a smaller epoxy diode that I
know the specs for. I'll start with it and go from there. Thanks
again.

```

Ok, well, with those thoughts in consideration.. I'm still a bit lost on where to start.   I know a local guy who has a SDR-1000 and I read his blog on blogspot. Very interesting. I did all the "googling" on it with a program called WebFerret. There is also GNUradio, and a few other projects going on in SDR it seems.

While tubes are cool, and I am sure very nice low tube count receivers/transmitters/transceivers could be built as they did ages ago.

Yes, I agree we live in a digital age.. and there are still many analog circuits around. Speaking of which, from just having purchased a copy of the 1985 ARRL Handbook today and having glanced through it. (I like old books to begin with).

Quote: "I don't know much about the book in question and the radio it builds,
but the parts you name are all computer parts, not radio parts. My gut
advice would be that you not build a computer but a radio :-)"

Well, thats what I intend to do. Well, half and half. Someone has to start somewhere.

I just wish I could rember everything my grandfather tried to teach me at a very young age.
For reference, I'm just about to turn 30. And, I started getting into this sort of thing around 1986.

As someone somewheres else suggested I have limited information, and well, I just need to fill in the gaps.. not nessisarily start all over. I barely know what to do with the probes of a DMM.. in my case a Fluke 8050A..

Well, yes I probably could put together a kit and learn that way. In other words, "I'm just a mentor short of a college thesis."

Oh yea, and I won't attempt to become a RF Engineer / Designer, well.. just yet anyhow. LoL.

Greg

> more "computer" parts.

And I think that's fine. I personally find those parts as detracting from what is interesting about homebrewing, up until you get to say a Software-Defined Radio, or maybe some hamshack accessories that let you use a computer to do clever things with your rigs.

I do feel it's pointless to build computerized gadgets when perhaps an already existing desktop PC can do the same job. Most digital modes beyond CW are really used much more effectively with a CRT than with little microcontroller-based LED displays etc. Little gadgets that turn a desktop or laptop computer from a blank screen into something that usefully interfaces to a radio are plentiful in the ham magazines and are fine projects.

> The main frequency-determining

Again, I tried to encourage him to go into SDR's as the cutting-edge of homebrewing.

> "Begin with a simple regenerative receiver?" I say a resounding
> NO to that.

You do have a point, the OP had a pretty kick-ass all-mode SW receiver already. Perhaps a simple rock-bound CW transmitter that could be used once he got his ticket would be a much more interesting project.

But you do correctly deduce that my first ham-band receiver was a regen built by me in 5th grade :-).

Considering that a complete working multimode multi-band (but used) HF ham rig can be bought for not much more than what the ARRL handbook costs new, homebrewing a complete rig is a non-starter for even those who've been doing simpler projects for decades!

So, thinking it over again, I'd like to advise the OP to find a simple CW QRP transmitter project that can be used with his existing receiver after he gets his ticket.

Tim.

IMHO:

>From what I gather, you don't have much experience with practical electronics. If I'm wrong about that, please correct me. Nothing wrong with inexperience, everyone starts out that way.

The main problem I see with something like the "Intelligent Transceiver" is that it is a very big thing to do as a first or even second project. Not that it can't be done, just that I cannot recommend it as the way to get started. It's just too big and complex for a beginner.

I recommend that you look around for a simple receiver or transceiver project to build. There are many designs on the web, and kits too. Most are single-band projects built around a handful of parts, yet capable of usable performance with a decent antenna. You can learn a lot from building one and getting it to work, and then move on to something more complex. In some cases ready-made PC boards are available, but you have to provide the parts and enclosure.

You will need some tools, test equipment, and a proper place to work. One of the advantages of kits is that the required tool kit is greatly reduced, but so is the amount of creativity and craft you put into the project.

Look around the internet and your Handbook for a simple receiver or transceiver project to build for a start. It doesn't have to use the latest technology in order to work and teach you many things about radio. Note too that many transceiver projects can be built as receivers by simply leaving the transmit components out until later.

Another poster here advised you to build a simple regenerative receiver. This is excellent advice, because a regen is about the simplest practical SW receiver you can build that will give useful results. It will also teach you a lot about construction technique and operating skill. It will also make you appreciate a superhet!

The advice to study an "All American Five" receiver, OTOH, is very bad, for a number of reasons:

1) You want to build, not take apart. In theory you could take an AA5 all apart and put it back together again, but that's not the same as building something new.

2) There is a good chance that if you can find an AA5, it will need to be fixed to make it work. While you can learn a lot that way, it's still not the same as building something new.

3) The end result of any such effort is going to be a basic receiver for AM broadcast. Not a transmitter or transceiver, and not a piece of amateur radio or SW equipment. If amateur radio/SW is your interest, it seems to me that your projects should be for amateur radio and SW, not AM BC.

4) AA5 receivers are of transformerless, "AC-DC" design. Usually one side of the AC line is directly connected to the chassis. If the plug is put in the socket one way, the chassis is connected to the neutral wire, but if it's plugged in the other way the chassis is hot-to-ground by the line voltage! Such receivers were almost always built in cabinets of insulating materials such as wood or plastic, and the chassis made inaccessible, because of the shock hazard. But in order to work on one, you want it out of the cabinet and powered up.

Working on one requires a lot of extra precautions to avoid getting a shock. Better to focus on transformer-operated equipment whose chassis can be directly grounded to minimize the shock hazard.

Tubes or transistors? They're both fun, and both have advantages and disadvantages. Solid state parts are generally more available new or new-old-stock (NOS), though.

Google my callsign to see some of my homebrew efforts.

And keep asking questions!

73 de Jim, N2EY

Hello Pete,

Thank you for your reply, and for the questions. My RF amplifier (HF) is solid state, and there is a Ham transmitter two doors down on the same side or the street I live on (urban environment) but no other AM transmitters *that I know of* in the vicinity. I live on the industrial side of town however, and imagine that there probably are some for the various trucking companies etc. which operate within five or ten miles of my home. The antenna is a longwire, consisting of approximately 100' of four (insulated) parallel strands of #24 AWG copper wire running along the ridge-vent of my house. This feeds into another 60' or so of RG-59 coax to shield against noise from the A/C compressor on that side of the house. It is grounded both where it comes off the roof and again where it comes in my window with 10' copper-clad steel grounding rods driven into the moist earth. The RF amplifier is a home-brew version of the MFJ 1020-A, using an air-gap (I hope I have this right) transmitter style variable capacitor for tuning, and has a 630V .1uF capacitor salvaged from the guts of an old TV connecting the center conductor of the coax to this tuning capacitor. I do not know the internal composition of this .1uF capacitor, but assume (hate that word) it is compatible with RF applications since it came out of the RF circuitry of a TV. I used to have a .22uF 50V polyethylene capacitor in its place, but that got blown, alerting me to the possibility of static charges coming down the feedline. Since my antenna is a longwire on the roof of my house, and it does routinely get windy, I imagine static will be an ongoing threat.

You mention that two Zener diodes in series could be used to clamp an AC voltage. Could they be used to defend against static? I have two 5.6V Zeners rated at 5W, and would love to employ them in this endeavor. I also have a couple of standard diodes rated at 600 volts PIV and 1 amp. I was thinking of using these, reversed and in parallel with the neon bulb, to take any voltage over the .6 volt threshold of silicon PN devices to ground. Do you think they would do this if I put them between the center conductor of the coax and ground? I am thinking that the "normal" signal level coming from the antenna would probably be something on the order of a couple hundred microvolts, and would therefore not be enough to drive the diodes into conduction. Does this sound reasonable, or am I way off base here?

Thank you for your time and interest. I really have no idea what I am doing here, but I am trying to figure it out and plan as best I can.

Best regards,

Dave

I would concur with those who suggest you're shooting a bit high for a first project(grin). Don't throw out that book - you'll be ready to build that project soon enough - but you should start with something a bit less ambitious. The "AA5" receiver idea strikes me as interesting but completely 100% irrelevant to modern electronics, both from the design standpoint and the implementation standpoint. Poking around an old transistor radio, on the other hand, might be worthwhile.

Firstly, do you have soldering experience? If not, I would suggest buying a bit of protoboard and a "grab bag" of electronic components for practice purposes. You wouldn't be looking to make any circuit that actually worked - just to develop the skills to reliably make good solder connections. The perfect design isn't going to work if the components aren't connected in the way the designer intended(grin) and solder joint problems can be VERY frustrating to troubleshoot. The ARRL Handbook has a section on soldering that includes pictures of proper joints.

(you really should have a copy of the Handbook)

After you're confident of your soldering ability (and I doubt it would take more than a day or two to get it down right) I would look at a modest kit as a starting point. Ten-Tec sells some direct-conversion single-band receiver kits. They actually do something (grin), (indeed they really do it pretty well) and are about the right size for a first construction project. There are other similar choices out there. A kit like this will also get you familiar with component identification.

When you're ready to start going after the transceiver project, do it in modular steps. Try to work in such a way that you can test each section after you complete it. For example, start with the receiver audio amplifier; it should hum when you touch the input, even if the entire remainder of the transceiver is missing. (i.e. you haven't built it yet!) That way, if something doesn't work (and it won't!) you don't have to search the entire radio for the problem; also, you'll get ego-boosting results sooner!

Hello all,

I'm manufacturing from a couple of years all sort of equipment for research (digestors, plasma generators, etc)using the microwave power field.
One of these is here: http://incdtim.netfirms.com/digestor_new.jpg

I was thinking I know everything about magnetrons. However some time
ago I've discovered a site where the magnetron was used as CW
transciever using a small power 12/4KV inverter.
Unfortunately I didn't saved those pages and now I would love to see
them again.
Does any of you know about what I'm talking about ?

thank you,
Vasile

To paraphrase from an old film, "we have a failure to
communicate?"

A PLL subsystem is essentially ALL digital with the exception
of the VCO itself. It uses "computer parts" and it can take
the place of a dozen or hundreds of quartz crystals, using only
one crystal as THE reference. All the parts are legacy and have
been so for at least two decades.

A DDS SOC (System On a Chip) can do the same, yet yield a much
finer frequency increment, still with quartz crystal stability
and control. It is all digital inside that SOC.

>I do feel it's pointless to build computerized gadgets when perhaps an
>already existing desktop PC can do the same job.

Why tie up a desktop PC to do things that can be done in a
small, dedicated assembly? A PIC microcontroller can be a
stand-alone frequency indicator...as witness to Neil Hecht's
fine products over on AADE. Or, how about a vector wattmeter
such as Larry Phipps' (N8LP) LP-100 unit that will also read
the complex impedance of the load? Or the Palstar ZM-30
antenna analyzer as a self-contained Z-R-X box to 30 MHz?
All enabled with "computer parts." All small, easy to apply
or portable with self-contained batteries.

> Most digital modes
>beyond CW are really used much more effectively with a CRT than with
>little microcontroller-based LED displays etc.

"Effective?" Using a desktop or laptop as an I/O device, and
the internal sound card as an extra digital processor and
A/D, saves BUILDING the equivalent. But, otherwise the PC
has only a larger viewing area and color display capability.

This is the HOMEBREW newsgroup and is about BUILDING at home.

I was trying to focus on the LEARNING aspect of getting
acquainted with the various stages of radios. I picked the
ordinary old table model radio as a representative of such
a LEARNING device for several reasons: There are thousands
of them sitting around in storage, unused, replaced by
newer BC receivers; the "All-American-Five" variety has
every basic stage in it...rectifier, mixer-oscillator,
gain-controlled IF amplifier, audio voltage and output
amplifier, plus tuned circuits; it can be forgiving if one

changes some parts values to see what happens; the RF and
IF stages have frequencies low enough to view with most
modern oscilloscopes. The theory part is very legacy and
can be found in dozens of basic text books. If they are
unused for BC listening now, few will complain if a beginner
tinkers around with it.

>Again, I tried to encourage him to go into SDR's as the cutting-edge
>of homebrewing.

I still disagree. Someone who is only a couple steps up
from crystal detector sets jumping into Software Defined
Radios is making MANY quantum leaps in theory just to get
the PROGRAM working. That program is the heart of SDR...
once there is a processor SOC that can work with the
right frequencies...or A/Ds that work at higher IFs.

Yes, modern cell phones HAVE such things and ICs ARE available
to do RF-to-baseband software-controlled receiver functions.
Ever try to USE one of those in a lab environment? It is
NOT for beginners.

>> "Begin with a simple regenerative receiver?" I say a resounding
>> NO to that.
>
>You do have a point, the OP had a pretty kick-ass all-mode SW receiver

Naturally using CW now that NO US amateur license requires
a code test? :-(

>But you do correctly deduce that my first ham-band receiver was a
>regen built by me in 5th grade :-).

It's irrelevant WHEN anyone BEGAN getting into the guts
of radios to find out how they worked. The real point
is the HOW of learning, the methods used. Everyone was
a beginner at first.

I built a SW BC regenerative back in 1947 as a teen-ager.
Out of an article in Popular Science. Outside of what
the article text gave, I didn't learn anything but how
to assemble one and solder (which I already knew from
middle-school shop class). I tried "quantum jumping" in
theory on different electronics-radio things back then
but didn't get focussed until entering the US Army and
getting into the Signal Corps. But, that is a personal
experience and isn't for everyone nor even recommended.

>Considering that a complete working multimode multi-band (but used) HF

>ham rig can be bought for not much more than what the ARRL handbook
>costs new, homebrewing a complete rig is a non-starter for even those
>who've been doing simpler projects for decades!

Sorry, but I'll say that is wrong...unless the ARRL suddenly
changed its prices for Handbooks by an order of magnitude.
"Multimode" beyond CW-only? Nah.

>So, thinking it over again, I'd like to advise the OP to find a simple
>CW QRP transmitter project that can be used with his existing receiver
>after he gets his ticket.

It can be checked out BEFORE getting any license...using
it on the bench with a dummy load. That will allow lots
of inspection and playing around with parts values before
connecting it to an antenna. One can do the same with an
AM mode transmitter or FM mode voice transmitter (FM is the
simplest but has to be on VHF and above)...although AM DSB
is frowned upon by the "gentlemen" who occupy the HF bands.

On Mar 17, 8:44=EF=BF=BDpm, N...@AOL.COM wrote:

> The advice to study an "All American Five" receiver, OTOH, is very bad, for a number of reasons:
>
> 1) You want to build, not take apart. In theory you could take an AA5 all apart and put it back together again, but that's not the same as building something new.

As a LEARNING experience it costs (almost always) nothing.

There must be tens of thousands still sitting around, doing nothing.

> 2) There is a good chance that if you can find an AA5, it will need to be fixed to make it work. While you can learn a lot that way, it's still not the same as building something new.

I disagree. The only one I've seen "not working" was already damaged beyond repair. :-)

I will repeat...it is a LEARNING experience. Since it is working, one can work backwards from that to see what makes it (or a stage within) NOT work.

> 3) The end result of any such effort is going to be a basic receiver for AM broadcast. Not a transmitter or transceiver, and not a piece of amateur radio or SW equipment. If amateur radio/SW is your interest, it seems to me that your projects should be for amateur radio and SW, not AM BC.

True enough, but such receivers still work by the same principles that apply to HF or VHF or LF or VLF.

An advantage to using AM BC is the known "signal sources" in the area. One doesn't absolutely need a signal generator to check or compare its performance.

> 4) AA5 receivers are of transformerless, "AC-DC" design. Usually one side of the AC line is directly connected to the chassis.

I have yet to see one that is so "directly connected to one side of the AC line." They may exist, but all the ones I've handled (maybe two dozen all told, different makes and models) have always used a capacitor to chassis from one side of the AC mains. As I recall, they all had UL stickers on them.

> ... But in order
> to work on one, you want it out of the cabinet and powered up.

Yes, but that applies to ALL such things, yes? :-)

> Working on one requires a lot of extra precautions to avoid getting a
> shock. =A0Better to focus on transformer-operated equipment whose
> chassis can be directly grounded to minimize the shock hazard.

Tens of thousands of tinkerers have gone before you and still survived without being "shocked." :-)

Electricians seem to survive just fine and some of them work directly with "hot" circuits...at higher voltages than a nominal 115 VAC. TV repair folks face 24 KV from picture tube ultors (the final accelerating anode)...even when the power is off and disconnected.

If all else is troublesome, a cheap 1:1 isolation transformer can eliminate all those "hazards." Cost in the neighborhood of $15-$20 for 50 VA. However, even if used, the "B+" is still at 140 to 100 VDC and is always there when working. Precautions are fine but let us use a little realism on "advice" - tube based devices nearly ALL have lethal-potential voltages present. The average solid-state device tops out at +/-15 VDC or thereabouts, NOT a lethal potential.

Google for "Injection locked magnetron" or substitute "phase locking
magnetron" and go from there. The link is for one paper on the subject
covering phase locking as well as injection locking. Injection locking
uses a circulator on the output of the magenetron as a means to inject
signal from a stable source.

I am looking for the AN/APT-4 jammer/xmitter, 15-1100Mhz, anyone happen
to have a copy?

Regards,
JS

I never had much luck with Microwave power transformers. They seem to
saturate with light loads and draw several amps of line current. If
the load isn't 600 watts, they go crazy, draw lots of current  and
```

heat up. They also have the laminations welded together which reduces efficiency (lots of eddy currents). Might be better suited for a boat anchor.

Pictures available in ABSE

The top trace (yellow) is taken between C4 and R2. The bottom trace (cyan) is taken at the base of the transistor. There is a switchercad file, but the simulation will show allot of distortion that really isn't present in the prototype circuit, because of lots of circuit capactance I suspect. R1 was something I was playing with to try and tame the voltage across L1/C3 being applied to the base.

Hello all,

I was tinkering with this LC oscillator (Colpitts/Clapp) this weekend. I arrived at the values of C1 and C2 empirically after starting with a crystal oscillator circuit. The values in the original circuit created a horrid waveform that looked allot like the simulation. After much tinkering around and simulating, I come to the conclusion that getting a perfect waveform is nearly impossible, especially with big swing. It seems that the transistor likes to take a bite out of the right half of the peak of the wave.

What is the secret to beautiful waveforms? Do I need another LC resonator on the output to fix it up? I mean, I'm getting a pretty nice wave now, but there is still some distortion that you can just see at the top of the peaks on the yellow trace.

How do you control the peak voltages of an LC resonattor without mangling the waveform? The waveform at the junction of L1/C3 is of course quite beautiful, how do I get it from there to the output? ;-)

I realize that I will need a buffer stage(s) before I can make any real use of the signal, but I want the input to the buffer to be as perfect as possible.

Thanks :-)

The waveform in a high Q tank that's lightly coupled to the amplifier should be very nearly sinusoidal. If in addition, the amplifier remains linear and represents a constant impedance over the whole cycle of the waveform, then the waveforms should everywhere be sinusoidal. If the amplifier+tank has barely enough loop gain to sustain oscillation, then clipping will be minimal, but it's also possible to detect the level and control the gain of the amplifier. You could, for example, use a light bulb like HP did in their original audio oscillator. Beware, though, that best oscillator performance in other regards may not be achieved the same way you achieve lowest harmonic distortion. Be careful that you optimize the right things for your application.

In the work I do, I need to measure distortion, and the generators I use don't have low enough distortion in their outputs to be directly useful. The distortion levels in the "raw" outputs are generally about -40 to -50dBc. I use filters to make things better, and can get to -140dBc distortion levels fairly easily. If it's low harmonic distortion you want, I'd suggest that it may be better to just put a filter on the output of the oscillator that has only moderately low harmonic output, and not worry so much about that aspect of oscillator performance. Filters work well when the oscillator frequency range is about 1.5:1 or less. Much more than that and you'd need to switch in different filters depending on the oscillator frequency.

Cheers,
Tom

Hello Anthony,

1.
Please set the following option to sitch off data reduction/compression
in the result file..

```
.options plotwinsize=0
```

2.
You have to set a small maximum timestep in the .TRAN line too.
Maybe a value of 0.01*Period of oscillation if you hunt for very low
distortion.

Can you send me your file (.asc-file and model-file?) to check it?

Best regards,
Helmut

The secret to a beautiful waveform is -- you usually don't need it straight from the oscillator.

There are a lot of things that you want out of an LC oscillator. Low phase noise, frequency stability, consistently strong oscillation, pure tone, etc. Of these, the only two that you can't clean up later in the following amplifier chain is low phase noise and frequency stability. Concentrate on those, & don't sweat the nice waveform.

Frequency stability and phase noise performance are often achieved by intentionally designing the amplifier so the active element operates in class C, without ever going into voltage saturation. This keeps it's drain (or collector) impedance high, yet delivers a large voltage swing to the gate (or base) to keep phase noise low. It also gives you a more or less consistent standing voltage in the tank, which helps the design of the following buffer stages.

If you absolutely positively must tap the World's Most Beautiful Sine Wave off of the oscillator section, consider a parallel-tuned tank that's loosely coupled to the active element. Then loosely couple your output tap to that -- it's your best chance.

After reading the other replies, it seems aparent that the shape of the
signal from the first stage is not that critical, it is stability and phase
noise that are most important. So, I should put things back where there is
clipping to be sure that the oscillator oscillates and then clean up the
signal in subsequent stages.

Digester or digestor is a device wich is able to reproduce fast any
digesting process
(like the one inside your stomach) including soil, human tissues,
chemicals etc.

I think the links I saw was one of those:
http://209.85.135.104/search?q=3Dcache:lmKTArGaPb8J:gbppr.dyndns.org/mil/he=
rf/index.html+phase+locking+magnetron&hl=3Den&ct=3Dclnk&cd=3D81

unfortunetely I can't see only the cache...

the trimmer should block all the dc.
im not convinced about the inductor in parallel with the crystal
it might work though.

Depends on what sort of signal you are trying to receive.

To receive a single our double sideband signal (or, in a very touchy
way, an AM one), you want your direct conversion receiver's local
oscillator exactly on the transmitter frequency.

But to receive a CW signal, you want your local oscillator 700 Hz or
so above or below the transmit frequency.  That will cause you to hear
a 700 Hz audio tone for the CW.

Unless I'm mistaken, 3.581 MHz is in the CW portion of the 80 meter
band.
If you can get to 1 KHz below the transmitter, you should be able to
copy CW as 1KHz audio.  If you can only get to 1.5 KHz below, you'll
get 1.5 KHz audio... not ideal listening, but probably workable.

Ow ow ow ow....... forgot to mention something........

Microwave oven transformers (MOTs) are current limiting. They have magnetic
shunts between the primary and secondary. You can short the secondary out,
and it won't blow any breakers. The transformer may hum loudly, but it but
nothing will blow.

That is why people say that they have poor voltage regulation when used in a
HV power supply.

You can remove the current limiting by just driving out the magnetic shuts
with a punch and hammer. The shunts are just stacks of transformer
laminations stacked up to make a square block, and press fit into the space
between the primary and secondary.

With the magnetic shunts removed, then the output voltage will go up, and
the output voltage regulation will be far better. You will be able to draw a
lot higher peak current from it. But be careful. There is no longer any
current limiting. If you short out the secondary, the breaker, or fuse will
blow.

Anthony

Your trimmer cap will block any DC flow to ground. If you are really paranoid then put a 0.1 mfd in series with the crystal.

If you do accidentally ground the crystal input terminal on that SA602, it only pulls the base of a transistor to ground and thus turns it off. That shouldn't hurt anything.

While you may not be able to purchase new "602's" now (they are long
ago declared obsolete) the Phillips SA-612 is the same unit and is
readily available from a number of outlets.

A datasheet for this device is located at:

http://www.nxp.com/pip/SA612AD_01.html

I "need" an increase of about .0546%. Isn't that about 546ppm?

> what freq you need ?

3581.5kHz to zero beat with the desired signal.

> whats the colourburst crystal freq ?

3579.545kHz.

Ok, I had to read that a few times to get it. A period between ".....100pf"
and "the input..." there would have been quite helpful. ;-)

> the negative part of the input impedance must be stronger than the
> loss in the tuned circuit.

So they do act like a voltage divider of sorts and shunt some of the
oscillator output to ground and some back to the input.

Cool, a way to figure out just how high you can pull it and how to attain a
certain frequency. I'll probably stick to tinkering though. ;-) Thanks
allot for the detailed explanation. :-)

Doh, I see that now. For some reason I was thinking that they crystal had
both pins connected to the oscillator on the 602, and not with one leg
grounded as the circuit has it. Having yet another senior moment I guess.
Only about the tenth one so far this week.

I saw that 612 part when I was poking around on the net. A fellow ham gave
me three NE602s about 15 years ago. I had fogotten about them and recently
found them. I even have a couple of tuning cap vernier drives he gave me.

aha ok, thats a fair bit, but maybe within range, as as been said at a
certain frequency the crystal becomes a complete open circuit.

Yeah I kinda got lost in my own explanation myself. didnt have much time to
explain.

>
>> the negative part of the input impedance must be stronger than the
>> loss in the tuned circuit.
>> this is affected by the ratio of the 2 100pf capacitors.
>
> So they do act like a voltage divider of sorts and shunt some of the
> oscillator output to ground and some back to the input.

this circuit is an emiter folower wich has no voltage gain,
so actually they operate in the opposite way wich is kinda confusing but let
me explain ...
consider a typical tuned circuit with LC and a tap in the L,
driving the circuit at the tap acts as a step up,
but the crystal is the inductor wich make it difficult to put a tap here,
but at resonance the 2 capacitors can act in the same way and provide a
voltage step up.

but you can see there is a curent loop involving all these components in
series,
this is what sets the frequency.

If you decrease the capacitor accross the 2 pins of the ic this will
increase the voltage accros it and so give more drive, as wel as increase
the frequency.

another way to look at it is if you consider that ground is at the base then
the capacitors are in fact a voltage divider wich feed into the emiter of a
comon base amplifier.

>
> Cool, a way to figure out just how high you can pull it and how to attain
> a certain frequency. I'll probably stick to tinkering though. ;-)
> Thanks allot for the detailed explanation. :-)

The pulling range is usually equal to the motional capcitance over the
crystal self capacitance, so for 14ff and 20pf this gives 700ppm, but
actually at this extreme its unusable in this circuit as its required to be
inductive.

as said by some1 else the farther you pull it the worse the performance.

It is, I mistakenly thought they did the 80 meter voice announcement down
there. The voice bulletin is actually on 3990kHz.

Since I have most of what I need (tuning caps, vernier and toroids/wire) I
started looking around at different VFO circuits. I'm trying to find
something that will span from 3500 to 4000kHz and still be fairly simple. I
could then inject this into pin 6 of the 602 and be done with it. :-)

Right. I was hoping to be able to "get on the other side" of the signal to
have a second chance at avoiding possible QRM.

For CW I don't, but I would want to be able to get on the other side for QRM
reasons.

My guess is the project's original author hadn't planned on that...
most likely, they'd planned on rubbering the crystal only far enough
to get a reasonable audio tone from the RF-LO combination.

Obviously you can get more range out of a VFO, though building nice
VFO's isn't simple.

Even the tuning caps can be a pain. I spent a while as a teenager
knocking alternate plates out of old 365 pf AM broadcast caps to try
to make some suitable for 40 meters - or you can use a series
capacitor. Beware hand capacitance when you go to tune it. Today,
varacter tuning is another option - stable regulated supply and a
multi-turn pot.

Another thing you might do is google the "poundshop" (dollar store) receiver projects. Those are little KHz-IF varactor tuned auto-scanning FM radios that people have been modifying into direct conversion ham band receivers.

I think you are getting close to the limits :-) You might get a few Hz more by reducing the value of the 2 100pF capacitors. Try another crystal or a ceramic resonator.

I didn't design it, but allot of folks seem to have had success with getting
it working. Like one poster said, I'm already within range to copy the
signal, but it would be about 1.5kHz. That's a tad high in pitch for my
taste. I was hoping to be able to get to the other side of zero beat, but
perhaps that was wishful thinking on my part. I've managed to get it 500Hz
higher than the marked frequency so I should probably be happy with that.
After all it's a crystal and it was designed to be operated well within
50ppm of its marked freq.

It's definitely worth keeping the transformer if you have space to store it, some people make spot-welders or arc welders from several microwave oven transformers, by removing the secondary winding and winding on a new one.

I can't think of many sane uses for the intact magnetron but perhaps there are some, given sufficient safety precautions.

I would strongly advise against applying power to the transformer with the existing secondary winding in place, unless you can be *completely* certain that you won't get a shock (e.g. all components and wiring should be inside an earthed metal box). Those transformers will arc through clothing, will provide more than enough current to kill you without blowing the fuse, and the primary to secondary isolation means that earth-leakage circuit breakers (also called residual current circuit breakers) will not protect you. I certainly don't mean to discourage you from using the parts from

the oven but that is one appliance that really could kill you so just be
careful.

Chris

I'll try and draw what I have in mind, and post it in alt.binaries.schematics.electronic. However, in the meantime, let me try and explain. The explanation may not be absolutely 100% complete, or even 100% correct, but it may help in moving a crystal more HF than it wants to go. Sorry that it's a bit rambling!

In Anthony's circuit (http://newenglandqrp.org/files/w1aw-receiver.jpg), the crystal will probably be functioning as a series-tuned circuit.

As Steve has stated, a crystal suddenly goes into parallel resonance just HF of its series resonance. This limits how far the series resonance can be pulled HF by the addition of a series trimmer capacitor. However, if this parallel resonance can be removed (or moved further HF), it should be possible to move the crystal further HF. The technique described certainly does work with VHF overtone crystals (between 50 and 200MHz), but should also work with HF crystals working on their fundamental frequencies.

A crystal is a mechanical device, but can be represented as being a series-tuned L-C circuit. (Call these L1 and C1.) Also, across the two is a parallel C (C2). Forget about losses (represented by a resistor). [Note: L1 and C1 are not actual electrical components, and only appear to have these values at or near to the L1-C1 resonant frequency. However, C2 essentially is a physical electrical capacitor consisting of the plating on each face of the crystal, with the crystal as the dielectric between.]

L1 is very large (possibly 1H or more, depending on the frequency). C1 is very small (say only a few pF or even a fraction of a pF - again depending on the crystal frequency). [So adding a relatively large series trimmer capacitor has very little effect on the frequency.] C2 is typically around 5pF, regardless of frequency.

Imagine doing a test where you look at the resonant frequency of a crystal, using a signal generator. This feeds an RF signal through a crystal, into a 50 ohm load. You measure throughput of the crystal by measuring the voltage across the load.

Swing the sig gen frequency slowly from LF to HF, through the resonant frequency of L1-C1. [Let's forget about C2 for the moment.] Below the resonant frequency of L1-C1, the L1-C1 circuit acts like a small capacitor, so there is very little throughput. Above the series resonant frequency of L1-C1, the L1-C1 circuit acts like a large inductor, so again there is very little throughput. However, when you hit the series resonance of L1 and C1 (F1), reactance of L1 and C1 cancel. The crystal acts like a short-circuit (or nearly so) and there is a large throughput. Because the L-C ratio is very high, the resonance peak is very sharp.

The effect of C2 across the L1-C1 circuit is to produce a second (parallel) resonant circuit. VERY slightly HF of the L1-C1 resonance, C2 resonates with effective inductance of the L1-C1 circuit. This produces a parallel resonant circuit (F2). Another way of looking at it is that L1 resonates with the series combination of C1 and C2 (so F2 must be higher than F1). The parallel resonance is, of course, a high impedance, where there is almost no throughput through the crystal.

As a result of this double resonance, the crystal acts as a series-tuned circuit at F1 (one you want), and a parallel-tuned circuit at F2. The transition between the two is very sudden. The frequency response peak of the throughput is very lopsided, and gets chopped off suddenly on the HF side.

The difference between F1 and F2 is very small (a few Hz to a few kHz, depending on the frequency and type of the crystal). If F1 is lower than you want, and you add an external series trimmer capacitor to try and pull the crystal L1-C1 series resonance HF, you effectively hit a brick wall with the parallel resonance at F2. The parallel resonance will block any throughput at (or near) this frequency.

A possible solution is to neutralize C2.
[Note: Neutralization is a technique sometimes required when using VHF crystals, as C2 may be large enough to allow the oscillator to free-run, instead of being locked to the frequency of L1-C1. However, it may also be used with advantage, as described below.]
You can neutralize C2 by adding an inductor across the crystal (ie in parallel with C2). The value required is that which parallel-resonates with C2 at the crystal frequency. In effect, C2 no longer exists. With C2 neutralized, there is no longer a sudden transition from the wanted series resonance F1 to the unwanted parallel resonance F2. The peak the response curve of the throughput of the crystal (at F1) is now nice and symmetrical, without the sudden cutoff at F2. In practice, the actual F1

peak will probably be somewhat more HF than before, and the crystal should be more pullable with a series capacitor.

Finally, if you reduce the value of the inductor so that its resonance with C2 is somewhat higher than the crystal frequency, this tends to pull the F1 resonance peak even higher in frequency. However, if you overdo this, the oscillation will probably unlock from the crystal, and start to free-run.

As I said, sorry for the ramble.
Ian.

If you do try an inductor across the crystal, make sure that you still
do have a DC blocking capacitor somewhere in the path to ground (as
provided by the existing C2 trimmer).
Ian.

OMG are you kidding, don't be sorry. Thank you way so much!!! :-))) You should set your clock to way in the future and repost that message so it sticks around for a while. ;-)

So to make a long story short I need to put an inductor of roughly 400uH across the crystal to cancel the 5pF of C2.   Wow that's a ton of inductance, but about 27 turns on a FT50-43 ferrite torroid ought to do it. I'll let you know how that works out. I found another crystal, unfortunately it's identical and possibly from the same batch. I haven't tried it yet, but I'm not expecting any miracles. I'm tired of burning my fingers unsoldering parts, so I'm goint to tinker on the breadboard with another 602 set up just for the oscillator testing with capacitor changes. I will apply the new coil to the soldered up version though.

The receiver hears, as we just had a storm earlier and I could hear lightning crashes in the distance. In my narrow tuning range, I can hear what is likely the carrier of a broadcaster too, or maybe my TV. Later tonight when the band opens up some more, I should hear something from W1AW hopefully.

Thanks again

Yeah, I probably expect too much from it. On a side note, IT WORKS. I can
hear stations, but the noise (man made) is something awful. It really needs
a narrow audio filter.

I found some stuff on those, the look pretty neat. I may have to head to
the dollar store and see what I can find. ;-)

>So to make a long story short I need to put an inductor of roughly 400uH across the crystal to cancel the 5pF of C2. Wow that's a ton of inductance, but about 27 turns on a FT50-43 ferrite torroid ought to do it. I'll let you know how that works out. I found another crystal, unfortunately it's identical and possibly from the same batch. I haven't tried it yet, but I'm not expecting any miracles. I'm tired of burning my fingers unsoldering parts, so I'm goint to tinker on the breadboard with another 602 set up just for the oscillator testing with capacitor changes. I will apply the new coil to the soldered up version though.
>
>The receiver hears, as we just had a storm earlier and I could hear lightning crashes in the distance. In my narrow tuning range, I can hear what is likely the carrier of a broadcaster too, or maybe my TV. Later tonight when the band opens up some more, I should hear something from W1AW hopefully.
>
>Thanks again
>
>

As you say, at around 3.5MHz, you will need a fairly large inductor to resonate with 5pF. An alternative might be to make a bridge circuit, where you actually use another (5pF) capacitor to balance out the unwanted 5pF. I used to use an extremely simple balancing circuit to make accurate measurements of the resonant frequencies and ESRs (equivalent series resistance) of VHF crystals, and it should be possible to use something similar in an oscillator. However, maybe someone out there can advise on a tried-and-tested circuit which will definitely work. [There's no point in re-inventing the wheel!]
Ian.

The other thread got me thinking, so I pulled out some equipment to do a little test.

I looked through my stack of magnetrons to find the worst looking one for the experiment. I found one that I had pulled out of an old microwave that had been setting outside for a while. The outer case was heavily rusted to the point that it wasn't likely that I was ever going to use it as a replacement if I had a microwave that had a magnetron die in it. But the inner tube, and cooling fins was in good shape.

I made up a transformer with a secondary of 3.3V under load, to drive the filament. The filament current is about 12A. Total filament wattage is about 40W.

For testing applications, I used a 0 to 350V DC supply, with a maximum output of 200mA.

With magnets in place I could run the voltage up to 350V and only a few milliamps of current would flow. The needle on the meter of the field strength meter setting right by the antenna of the magnetron never moved. 350V is way to low for the electron stream to overcome the restraining force of the magnetic field, to allow anode current. Let alone generate enough radial electron velocity to start oscillations.

So, I took off the outer case off the magnetron tube assembly. I removed the two magnets. Then I hooked it up to the filament supply and checked it again. Without the magnets, it conducts a LOT more current at low voltages.

Here is the basic current voltage and plate dissipation readings.

50mA at 80V 4W
100mA at 134V 13.4W
150mA at 172V 25.8W
200mA at 220V 44W

Estimated 500mA voltage around 500V or 250W

Not quite as good as a 5U4 element.

But pretty close to the voltage drop you would see from a 5Y3 element.

With a PRV of well over 4KV. Probably easily 10KV. I don't have the equipment on had to see how high of a voltage it will take before it flashes over. The obvious limiting factor that I can see is the spacing between the filament terminals and the grounded case(plate) of the tube. With the tube I have, that is about 5/8 of an inch. The reference book I have shows the worst case breakdown situation(needle gap) to be about 20KV for that distance. Best case, about 40 KV. If the tube would flash over internally first, is something I don't know.

Power supplies based on two magnetrons with the above specs.

For a 2KV 200mA 400W supply.......
A full wave supply with a 2.2KV-0-2.2KV transformer driving two de-maged magnetrons driving a filter choke.
It would drop about 200V in the magnetrons.
Power loss would be 40Wfiliment plus 20W plate loss, for a total loss of 60W each.
Total losses would be 120W at full load. 80W at no load.
77% efficient at full load.

For a 4KV 200mA 800W supply.......
A full wave supply with a 4.2KV-0-4.2KV transformer driving two de-maged magnetrons driving a filter choke.
It would drop about 200V in the magnetrons.
Power loss would be 40Wfiliment plus 20W plate loss, for a total loss of 60W each.
Total losses would be 120W at full load. 80W at no load.
87% efficient at full load.

For a 4KV 500mA 2000Wsupply.
A full wave supply with a 4.5KV-0-4.5KV transformer driving two de-maged magnetrons driving a filter choke.
It would drop about 500V in the magnetrons.
Power loss would be 40Wfiliment plus 250W plate loss, for a total loss of 290W each.
Total losses would be 580W at full load. 80W at no load.
77.5% efficient at full load.

The largest supplies you could probably make is a 10KV 500mA 5,000W supply with two tubes and an efficiency of 90%.

Or a 20KV 500mA 10,000W full wave bridge supply, with four tubes, with and efficiency of around 90%

There is a couple lower wattage magnetrons I have, that have a filament current around 8A. The largest one has a filament current around 15A

The neat thing is, you can see the glow of the filament through the ceramic ring on the top of the tube. The ceramic ring gives of a light orange glow.

Hope people on the news group find this info interesting, if not useful.

Thanks John. :-) I was referring to core saturation and when to suspect it/materials/etc, but I can sure stand to learn a few things more about crystals too. That's pretty good information in the link you posted. If anyone knows about crystals it should be Fox. ;-) I had never tried pulling one high before, only tweaking them down a little to get them on frequency. I can pull this one low several kcs without much of a problem other than stability, but it sure doesn't want to go any higher than about 500Hz above spec. I'm going try the parallel inductance trick to see if I can get the frequency higher, that should prove interesting. I like doing reality vs. theory experiments. ;-)

Hello Andrew,

Do you know of any freq response curves on the web for the garden
variety electrets? I've looked and haven't found any.

Thanks,

Chuck NT3G

> Do you know of any freq response curves on the web for the garden
> variety electrets? I've looked and haven't found any.
====================
I found an Archer packaged (for Tandy)  cat no 270-092B  Electret
Condenser Mike Element in its original Package, complete with response
curve.
 From 30 - 3000 Hz the response is flat.
 From 3000 Hz to 5000 Hz the response increases by approx 10 dB.
 From 5000 - 9000 Hz the response drops such that it is back to its
original level at 9000 Hz .Above that freq the response drops.
Response curve is not extended beyond 12000 Hz

Just to set the record straight....

Someone suggested that you need to 'neutralize' the parallel resonance so the series resonance can be tuned toward it. This is completely wrong! The series resonance is, for practical purposes, invariant. The motional parameters (L and C) of the series resonance are such high reactances (small capacitance; high inductance) that external components have only a tiny influence on the series resonance.

The series resonant frequency is the lower of the two crystal 'resonances'. The parallel resonance is above it. When you make a VCXO with any substantial tuneability, you're probably operating the crystal at its parallel resonance. This leads to the common observation that you can 'pull' a crystal up in frequency more than you you can pull it down. You can only pull the parallel resonance to approach the series resonant frequency, but you can't pass it because the crystal is effectively a short-circuit at that frequency.

Also for the record, the crystal's quartz only has one fundamental and significant natural resonance - the series resonance. The so-called 'parallel resonance' is actually a controlled spurious resonance caused by the holder capacitance. At frequencies above series resonanve, the crystal's RLC equivalent looks inductive, and at some frequency the holder capacitance will resonate that net inductance.

Yes....this is the point of a VCXO...to allow an almost infinitessimally small, but still useful, variation about the crystal frequency while maintaining most of the crystal's stability.

> The series resonant frequency is the lower of the two crystal 'resonances'.

Nearly all VCXO's I've run across work the other way. You can pull the frequency down substantially while maintaining good stability (typically on the order of 0.1%), but not up. This certainly applies to the circuit for which the original poster provided a link.

Do you have any examples of practical circuit schematics which use parallel resonance and which can be pulled substantially up in frequency ? I assume it should be possible to do with a parallel inductor, for example in a Franklin oscillator circuit, but as was pointed out the inductor values can be inconveniently large.

Steve

I saw somewhere that you could use an NE-2 bulb between the antenna "hot" lead and ground as a static discharge device for a receiver, but can't find an NE-2 and don't know anything about neon bulbs. Anybody know if a standard neon bulb rated at 125 VAC could be used in this manner? Or how I could test it? I'm thinking about charging up a 50V electrolytic capacitor and hitting the bulb with that, to see if it discharges the cap. I have a .22uF 630V mylar cap between the antenna and the input to the tuner because the 35V disc I had there got blown, so I know that static can be a problem with my setup even though it is grounded at two points.
Would welcome any ideas anyone has on how to make this work...

Thanks,

Dave

This was fairly common in WWII era radios.

A NE-2 fires at around 90-110V, which is more than a lot of solid state equipment can handle, so the protection offered is dubious with modern radios.

That said, it certainly can't hurt anything to try it if you have some weird problem with static.

You can still get them, but probably not locally.

Jameco (http://www.jameco.com/) still carried them last I looked.

To see where a particular bulb actually fires, put the bulb in parallel with a capacitor and feed it with around a 100V or so DC though a resistor of a few K.

You will have built a relaxation oscillator. The larger the cap and/or resistor, the lower the flash rate.

If you don't have a 'scope to measure the voltage, increase the resistor size until the flash rate is slow enough to watch the cap charge with a voltmeter.

============================================
To avoid  building-up of static you can fit a say 47 Kilo Ohms
non-inductive resistor  between what you call the 'hot'  lead and earth.
This would not affect the received or transmitted signal.

I have fitted 2 non-inductive (carbon) 1 Watt resistors (47 KOhms)  from
```

the incoming balanced feeder to earth at the Antenna Matching Unit.
This approach is obviously also OK with an incoming coax feeder.
At 100 W RF output the voltage would be 71 V at the transceiver. This would dissipate a little over 0.1 Watt in the 47K resistor fitted at the transceiver. Metal-oxyde resistors can for this purpose also be considered as non-inductive.

Frank   GM0CSZ / KN6WH

I've got a set of four epoxy block diodes that I would like to use in my next home brew amplifier power supply. The problem is that the company that made them, CSdc (Conditioning Semiconductor Devices Corporation) was bought up back in the 80's and I can't find anything on the web about the value of the devices. I would sure like to know what C67-6225A by CSdc is. They are 1 inch square by 5.5 inches long black epoxy blocks. Any help would be greatly appreciated.
Thanks,

Ken K4XL

I should have added that you can't use the neon if there is a transmitter
attached to the same line.

Thanks for the reply, Jim.

While waiting I set up a charging system for a cap and then tested to see whether the bulb would discharge the cap. No go. I am sure that at a high enough voltage the bulb might help, but I am going to have to use a resistor in parrallel with the bulb, or some other setup, to guard against relatively low voltage static buildup.

Thanks for the relaxation osc. idea. I might actually use that in m search. Never would have thought of it.

Much appreciated...

Dave

Thanks for the input, Frank. I believe this, or something like it, is what
I am going to have to do. I've already got the bulb installed in the
receiver case, and I guess I'll leave it there to warn me of impending doom,
but the resistor idea is what will probably save my bacon.

Is a metal-oxide resistor the same thing as a metal-film resistor? Or would
that be inductive and mess with my incoming signal?

Thanks much,

Dave

BTW, this brings up another question: I have read that carbon composition resistors have a small amount of capacitive reactance due to the tiny particles that make up their mass, and should not be used for RF projects. But metal film resistors are inductive. So what kind of resistors should I be using in my RF projects? Is there a third type?

Thanks,

Dave

Most CB radios use a pair of back to back diodes across the receiver input. I also recall the input of the ECG amplifiers also have the same network to protect the Input circuitry from being blasted by the Pulse from Defibrillator Paddles (1~5 KV.). These Back to back Diodes Clamp the Voltage to the Forward Voltage Drop of the Diodes in question at around 0.6 Volts. This circuit works much better and for cheaper than the NE2 at ~60 Volts. If Static Electricity (lightning) is a problem at a specific Frequency, a Grounded 1/4 wavelength shorted Stub could be wired into the Feedline to present a DC ground to the entire antenna system.

Of course! Back to back diodes! Why didn't I think of that? Thank you,
thank you, thank you. How obvious! :)

But is there any way that I could still use my neon bulb to let me know if a
pulse of high-voltage static hits the input to the receiver? I would love
it if there were some way to make that still work...

Question on this last note: What if I put the back to back diodes in series with a 100K resistor, and they together in parrallel with the neon bulb. Would that slow the discharge of a fairly large static pulse enough to light the neon bulb, even briefly? I have the input to the receiver protected by a fairly high-voltage (non-electrolytic) capacitor, so I'm not too worried about the slowed-down pulse getting through to the rest of the circuit. And if it did get through it would find an air-gap transmitting variable capacitor next in line as the tuning cap. Is this a dumb idea, or might it behave as I desire? Any ideas?

Thanks,

Dave

>Just to set the record straight....
>
>Someone suggested that you need to 'neutralize' the parallel resonance so
>the series resonance can be tuned toward it. This is completely wrong!

It may be 'completely wrong', but my experience with getting out-of-spec (too LF) VHF overtone crystals up to the required frequency indicates that it does enable the oscillator to work at a slightly higher frequency than it 'wants to'. This is because the throughput peak of the series resonance moves HF when the sudden parallel resonance is removed. [The assumption is that oscillation occurs at the peak of the series resonance, which may not be entirely true.]

>The
>series resonance is, for practical purposes, invariant. The motional
>parameters (L and C) of the series resonance are such high reactances (small
>capacitance; high inductance) that external components have only a tiny
>influence on the series resonance.

This is more-or-less what I said. The influence of the relatively large series trimmer capacitor will be pretty small.

>The series resonant frequency is the lower of the two crystal 'resonances'.
>The parallel resonance is above it. When you make a VCXO with any
>substantial tuneability, you're probably operating the crystal at its
>parallel resonance.

Lots of technical information calls the actual parallel resonance 'anti-resonance', and indicates that there is an 'area of parallel resonance' between the true series resonance and the spurious parallel resonance. In this area, the impedance of the crystal rapidly changes from being zero (at the series resonant frequency) to infinitely inductive (at the anti-resonant frequency). In many oscillator circuits, the oscillation occurs neither at the series resonant nor the parallel (anti-) resonant frequencies. Instead, the actual frequency of oscillation will be determined by some value of this inductance and the external capacitors, and also on the phaseshift and amplitude of signal throughput through the crystal. All very complicated!

>This leads to the common observation that you can 'pull'
>a crystal up in frequency more than you you can pull it down. You can only
>pull the parallel resonance to approach the series resonant frequency, but
>you can't pass it because the crystal is effectively a short-circuit at that
>frequency.

And neither can you use external elements to pull the series resonance very far HF, because it runs into the parallel resonance. From my experience, a swept frequency response through a crystal shows that the throughput peak of the series resonant frequency never really reaches its full amplitude before it starts to get pulled down in parallel resonance hole. Neutralizing the shunt capacitance prevents the parallel resonance from occurring so close to the series resonance. As a result, the frequency response throughput curve becomes symmetrical, and the actual peak is somewhat further HF. Certainly, my oscillators (which were supposed to operate at the true series resonance of the crystal) DID move HF when I neutralized the crystal.

[Note that the full frequency response of a crystal with a parallel neutralizing inductor, from DC to well above the crystal frequency, consists of a broad notch centred on the crystal frequency (the parallel resonance of the parallel capacitance of the crystal and the neutralizing inductor). In the centre of the notch is a very narrow bandpass (the series resonance of the crystal).]

>
>Also for the record, the crystal's quartz only has one fundamental and significant natural resonance - the series resonance. The so-called 'parallel resonance' is actually a controlled spurious resonance caused by the holder capacitance. At frequencies above series resonanve, the crystal's RLC equivalent looks inductive, and at some frequency the holder capacitance will resonate that net inductance.

Exactly so.

At the parallel (anti-) resonance, the reactance of the crystal suddenly jumps from being infinitely inductive to being infinitely capacitive (0p). As you move further HF, it stays capacitive, progressively decreasing in reactance. The parallel resonance therefore presents a brick wall, beyond which external capacitors cannot resonate with the inductive reactance of the crystal. However, if you neutralize the crystal, you kill the sudden transition from series to parallel resonance, and the frequency range over which the crystal is inductive is considerably extended. This should enable the resonance with external capacitors to extend further HF than when the crystal is not neutralized.

As I originally said, neutralization of the crystal was a suggestion, rather than a panacea. I still reckon that should work. It's worth a try. Unfortunately, the size required for the inductor (which resonates with the crystal parallel capacitance of appx only 5pF) is rather large. If neutralization DOES help, a brute force method of allowing a somewhat smaller inductor to be used would be to deliberately add MORE parallel capacity, and lower the value of the inductor to suit. A more elegant method would be to build the crystal into a simple bridge circuit, so that a neutralizing capacitor could be used instead of an inductor. However, I appreciate that the object of the exercise is to make a simple receiver, and it would be somewhat incongruous to need a very complicated circuit just for the crystal.

Ian.

I have to agree with Joe. Basically there is no such thing as an crystal oscillator in "parallel resonance". However there are oscillators that use the crystal in the feedback path to add substantial phase shift. Such as in the Pierce oscillator where it behaves inductive. The phase shift changes so rapidly that it can still make a low-drift oscillator.

In the book by Matthys where he compares various oscillators there is one in chapter 10.6 where the deviation from the (series) resonant point is the highest. It is a circuit where the crystal sees a very high impedance as opposed to regular circuits where highest Q is obtained with very low impedance. This in effect makes the crystal load to be around C0 of the crystal with some output and input capacitance. And therefore it is probably the smallest effective physical series capacitance obtainable and thus the highest frequency.

Looking up the Franklin oscillator you mentioned, I notice this also is providing a high impedance to the resonant elements. So yes, it seems a valid way of implementing an alternative to Matthys' example.

Now also cancelling the effect of C0 of the crystal by adding parallel inductance might push it a bit further. Right now I would not be able to predict the effect on loaded Q of the crystal. Lowering Q is normally not done, but in this case we are primarily in quest for wide pulling range right?

In a low impedance Butler (overtone) oscillator I have seen C0 cancellation by using parallel inductance as well. There sometimes is an L plus series R used to lower the Q of the L/C0 combination. This seems not appropriate for a high impedance oscillator circuit. I would expect best effect if the Q of the inductor is high (low Rs).

Sorry this is still theory. I have no examples of VCXO in this context.

Cheers,

Joop

Why would the inductance be of any concern? It would
be effectively in series with the resistance, thus raising the
device's impedance... I'd think that would lessen the
loading on receive or transmit signals.

It's only possible to pull a crystal a little way from its center
frequency
by external components. If you put a resistor in parallel with the
crystal (to lower its Q) you can increase the pull range.

The reason for the parallel inductance in the overtone mode is the
low impedance of the crystal self capacitance at high frequencies,
this on its own can be quite low, and the series resistance
at overtone can be quite high, so this can allow the tank circuit to
dominate rather than the crystal unless it is cancelled.

Not sure about the resistor not seeing the circuit.

the statement all crystal circuits operate in series mode stems from the
fact that the internal eq circuit of a crystal is a series LC, any
capacitance in parallel with the crystal can only be in series with the
internal motional capacitance.

If your lucky you may be able to find a spurious node, but it would be hard
to make it oscillate at this point.

Try a full duplex repeater using solar cells at the top of the hill.

John

While he is "out in the boonies", the other end of any Internet access link that he establishes will have to be in a residential or municipal environment in order to get access to Internet facilities. That alone puts some obvious restrictions on what he will be able to do.

Then you don't need the resistor I mentioned.

No. I was suggesting a resistor across the transformer secondary -
from grid to grid. But since your setup is zero-bias Class B, my
concerns don't apply. The 813 grid/screen connection you are using
provides a load
for the driver.

I think the series-resistor idea meant a small (~100 ohm)
noninductive resistor in series with each grid lead, installed right
at each 813 socket, in case of instability. You obviously don't have
that problem.

They don't make the blue blades anymore.

Do they make any other kind of thin shaving razor blades?

Hello all,

I was playing around and saw that my junk box had all the parts so I started tossing this together:
http://newenglandqrp.org/files/w1aw-receiver.jpg
The problem is (well I think it's a problem) is that I'm all the way down to a 10pF cap for the crystal trimmer and the highest frequency I can get out of it is still less than 3580kHz. Pleae correct me if I'm wrong, but I'm thinking that the 20uH inductor is supposed to pull the colorburst crystal high in frequency then the adjustable cap should be able to tweak it back down. Higher capicitance does result in even lower frequency. I made the 20uH inductor by wrapping 17 turns on an old amidon FT50-61 ferrite toroid. I don't have any way to measure the inductance, but by my calculations it should be approximately 20uH. Is the ferrite saturating and messing things up? I see that touching the 20uH inductor it will cause the frequency to shift down as much as 4-5kHz.

I believe this is direct conversion and that the crystal should exactly match the desired station (3581kHz) I want to recieve, that's right isn't it? Maybe this is close enough? I have to wait til tonight to see if I can actually hear anything.

I mostly tinker with PIC chips so this is pretty much out of my league. I just wanted to throw it together and listen to the nightly report. It seems to be working as I can touch the 7.8uH coil (40 turns on a T50-2 toroid) and I get increased noise out of pins 4 and 5 on the NE602 (hey it's what I had in the box ;-). I haven't added the 386 yet, I just wanted to test the front end first. I'm cramming it all on a RS 276-259 pc proto board, but the layout is coming along pretty well for not planning it out. ;-) Thanks for helping.

It's interesting that I don't see that oscillator circuit arrangement
at http://www.ace.ual.es/~jgazquez/icons/ne602.pdf
I guess you're attempting to drag the xtal off freq? Why not just use
a tank?

Yes, but the blueing was what made a detector.

Thanks for the reply. I should have been more clear, the desired frequency is 3581kHz so yes I need to pull the crystal up in frequency about 1.5kHz. Right now I'm only able to get to just under 3580. It seems that much inductance should have more effect than moving it up only about 500Hz, but this isn't my bag.

By tank I guess you mean to rid myself of the crystal and use an ordinary LC circuit? I think I can come up with something simple, but I'd rather just get this working if at all possible. Do you have any idea what impedance the 602 wants to see on it's oscillator? I have a couple more chips and I could try and cobble something together if I knew what impedance to target.

Try going smaller than 10 pF (you can put a 10 pF fixed capacitor in series with the trimmer).

Get rid of the series choke and just use the small value variable
capacitor to go higher in frequency. I believe the inductance will
lower the frequency--the combination works to give an increased
VXCO range if I am not mistaken.

Dear Joe: My ISP had a serious problem with the news server and only this
afternoon have I been able to get to this group.

While my ISP's server was down, I was able to read a slightly garbled copy of your helpful message using Yahoo. Unfortunately, E-mail addresses were smeared. So, I did a Google search for a "Gary" who was associated with RACAL, and eventually had success.

I asked Gary about the 488 codes and, a few days latter, he sent me a well formatted list. I intend to exercise the codes as soon as I get a break and then get back with Gary to confirm/expand on the codes.

This is a long way to say thank you to Joe WA9LAE and to Gary.

I also thank Dan Rae who noted that some of the manuals contain the information.

73,   Mac   N8TT

If the series capacitor is very small, the oscillation will stop. In these circumstances, I have successfully pulled VHF crystals (3rd, 5th and 7th overtone, between 70 and 200MHz) HF by adding an inductor IN

PARALLEL with the crystal. The value will be somewhat less than that
required to neutralise (ie parallel resonate with) the parallel
capacitance of the crystal. The lower the inductance, the higher the
frequency.
Ian.

You have a capacitor and inductor in series.
Capacitive reactance = -j/(wC)
Inductive reactance = +jwL
The net reactance [jwL-j/(wC)] may be capacitive (negative) or inductive (positive).

Reducing the inductor makes it less inductive i.e. more capacitive.
Reducing the capacitor also makes the net reactance more capacitive.

You turned your trimmer all the way down to 10pF and it wasn't enough, so try taking a few turns off the inductor.

Use less inductance or replace it with a wire link.

You need to reduce the inductor.. that is causing a down swing in your freq.

What does that have to do with dangling the blade from dental floss? Or,
for that matter, what does dangling a blade from dental floss even DO?

Thanks,
RIch

>
> Use less inductance or replace it with a wire link.

I did this and now I'm up to 3580.050; an increase of about 70Hz or so.. I don't understand how this was designed to work. What is making the crystal oscillate above its design frequency? I thought the inductor had something to do with it, obviously not. Is it being operated in series mode instead of parallel?

I tried putting small cap in series with the adjustable one and that just greatly narrowed the tuning range and only slightly raised the frequency. It seemed to be getting unstable at that point as my old frequency counter started showing variations of quite a few hertz each update instead of remaining steady. It could be the amplitude is too low and the counter is missing ticks.

If you want a VXCO, you use the capacitor and inductor to achieve
maximum range of the crystal frequency.

An inductor in series will lower the frequency.
A capacitor in series will raise the frequency.

Eliminate the coil and just use the series trimmer to see how
how high the crystal frequency can be raised before it becomes
unstable or quits oscillating.

As Ian suggested, you can add an inductor ACROSS the

crystal to raise the frequency. Think of the crystal as being
a parallel LC circuit (over simplification) and you'll
be better able to visualize how this works.

Try a few other color burst xtals in the circuit for the heck
of it. You may not be able to pull the crystal that far.

If you want to compress the range of 0-30 kHz to something like 0-12 kHz you can do that with a switched capacitor delay chip like the Panasonic MN3007.

It will work like the bat detector, except it won't need to clip and threshold the audio. You will need to use a slow ramped VCO (continually ramping the sampling frequency down) in order to do this.
There are some projects at:
http://www.geofex.com/
You may be able to adapt a flanger, for instance, to suit your purpose.

The control voltage to the sampling VCO will be a sawtooth wave. Unfortunately, you will hear the sawtooth period as an artifact in the output. Maybe you can filter it out.

I guess an all-digital solution is better ;-)

Micheal

You have a good memory.  MHZ Electronics was dumping
5.9XX USB, LSB and CW filters in full page ads in Ham
Radio Magazine back in the late 70s or so if my memory
holds. I remember buying several of each for future projects
that never have materialized.

Pete

Thanks, I took it out and the frequency increased by only about 70Hz, but it did increase. :-) Do you know of anything else I can do to increase the frequency by about another couple of kcs?

try a different Xstyle, it sounds like your at the limits..
   it's possible the chip has too much capacitance on the
osc legs, i suppose you could try a stand alone osc with a
high freq transistor to lower the cap. use a buffer on the
stage to drive the chip .
   Also, have you considered the board mounting? you could
have to much cap via your board construction.

maybe the Q of you inductor is too low, try an air core,
needs lots more turns, a trimmer core as a core is good too.

Also you should test it with the crystal shorted,
then when you get close to the frequency you want put the crystal back in.

My W1AW receiver uses the crystal with just a 5-47 pf variable capacitor...no inductor, and it nets right on frequency. Try shorting the inductor and see if this gets you closer to the required frequency. Not all color burst crystals were created equal. If you have another crystal you might want to try it.

Your ferrite will not be saturating at the small amount of signal you are sending through it as part of an SA-602 oscillator.

> John
> AB8O

Off the top of my head.......

The HV transformer. Output 1 to 2KV at several hundred to a thousand KVA

HV capacitor 1 to 2+ uF at several KV

HV diode. several KV PRV.

Magnetron..... I don't know what I could do with them, but I keep them anyway. Maybe if I ever get into plasma physics, or building my own fusion reactor, I'll be set.

A thermal limit switch that is mounted on the magnetron.

A set of large magnets that is mounted around the magnetron. The outer magnetron casing can usually be disassembled to remove them. They can be used to make generators and the like.

If you do remove the magnets from the magnetron, don't throw away the actual magnetron tube. With out the magnets, it acts like a normal vacuum tube diode. with a PRV of several KV, and a peak cathode current of up to an amp, a pare of them would work good in a HV power supply. Filament voltage is usually a couple volts at a few amps.

Several NO switches on the door for safety interlocks, and timer control.

A relay, or high power triac for controlling power to the transformer and magnetron.

A light bulb that lights the inside of the microwave.

A fuse or two. Will save you a trip to town if you have another project that blows a fuse at an inopportune time.

Sometimes a smaller transformer with about 4 to 12V ac output for powering the timer/display.

If you are into getting the last drop out of a salvage mission, then you can usually get a moderate number of transistors and diodes off the timer/display board.

The only problem I have found with doing the last thing on the list, is you tear the microwave apart, then the last thing you do is go after the timer

board. When you get done pulling all the parts off of it, and you test them
to find out what they are. (NPN, PNP........) you find one that is
bad.......... Then it hits you........That component ran the this and
that....... That bad component is why the microwave wasn't working.......
Then you have to decide if it is worth putting it all back together after
you find out what died........ I usually don't.

Your color burst crystal is ground to ring at 3.579545 MHz, and if
you try to run it at another frequency you'll run into drive and
tempco problems which will make it worthless.

A sharp observation indeed.

Looks like you are quite likely correct. Without the inductor and with a
10pF cap in place of the variable cap, I can get the frequency up to just
over 3580kHz. I did some looking around and it appears that if I were to
parallel another crystal, I could get a bigger spread on frequency. Or I
could just try a different crystal too. I think I will tinker on a
breadboard to see how high in frequency I can get the crystal to vibrate.

I did this and it will go slightly higher in frequency, but it gets a tad unstable (could be the counter too, I wish my new scope would get here). I guess I'm at the limits of that particular crystal.

It hasn't stopped, but it has gotten weak or unstable (I can't be sure right
now) with capacitance below 10pF.

> and 7th overtone, between 70 and 200MHz) HF by adding an inductor IN

Are you referring to the capacitance inside the crystal, or the 100pF
external cap?  Do you have a ballpark number on the inductance value I
should try?

I understand that, but I don't use values like j and w, just 2, f and PI.
;-)

I took it out, and it's still too low in frequency. :-(Back to the drawing board I guess.

Ok, just like an antenna

> A capacitor in series will raise the frequency.

Same thing again, just like an antenna. However, when I increase the series capacitance, the frequency drops instead of going higher. This I don't really get.

> Eliminate the coil and just use the series trimmer to see how
> how high the crystal frequency can be raised before it becomes
> unstable or quits oscillating.

Did this, it helps, but when capacitance is below about 10pF, it seems to get unstable and I still can't achieve the frequency I desire.

> As Ian suggested, you can add an inductor ACROSS the
> crystal to raise the frequency. Think of the crystal as being

Can you suggest a value to start with?

> Try a few other color burst xtals in the circuit for the heck
> of it. You may not be able to pull the crystal that far.

That's what I'm thinking now, it just won't pull that far high. I can sure pull it low though. Maybe I should try a 4MHz crystal and pull it down to 3990, this is where the voice transmissions are anyway.

I know that I'm "violating the specs", but that's the intent here. Most of the circuits I've encountered tend to pull the xtal down in frequency (just add capacitance), but this case is odd in that W1AW transmits just above the colorburst frequency. I can pull it down several kcs pretty easily, I just can't get it above the specced value by more than about 500Hz. I think I just need to try a different crystal or maybe two in parallel. The parallel inductance idea is interesting as well, never done anything like that before.

As for stability, as long as it's not causing warbling audio, I'm not too concerned. :-)

Agree. Even a bog standard electret for $1 will do it - probably
wouldn't even need an amplifier......if you want to get sophisticated,
put it in the end of a piece of 30mm plastic pipe - voila, directional
microphone....

The alternative is you are just being paranoid......but I know you
know that anyway...

Andrew VK3BFA.

Good list we could add:
hardware (screws, washers etc)
mains power cord
some models have motorized wave "stirring" or magnetic drive platter turners
keypad for PIC projects

All in all, there's allot of good stuff in one. I shouldn't have thrown my
old one out.

Its only a pull of ~100ppm, this should be easily pullable for most
fundamental xtals.
ofc if the tolerenace all add up against you you might find it hard.

I would also try reduce the 100pf caps on the sa602 too.
100pf is higher than most crystals I use would like,
50pf or 20pf or if youve got some spare trimmers ...
you can adjust the ratio too, say just reduce the one accross pin 6-7

Pleae correct me if I'm wrong, but I'm thinking that the 20uH inductor is supposed to pull the colorburst crystal high in frequency

The inductor will pull the crystal down in frequency, as others have suggested.

In fact it is extremely difficult to pull a crystal's series resonance up in frequency more than a few Hz. This is because the crystal's parallel resonance is just above its series resonance. If you put a capacitor in series with the crystal the series resonant frequency goes up...BUT...if you approach the parallel resonant frequency you can no longer get a low impedance resonance condition since the crystal's parallel resonance makes the crystal look like an open circuit, regardless of what you put in series with it.

If you want to understand this better, try to find a reference with a good discussion of the equivalent circuit of the quartz crystal resonator. the only one I know of at present is Kenneth K. Clarke and Donald T. Hess, Communication Circuits: Analysis and Design, Addison-Wesley Publishing Co., 1971. It may be a bit hard to find outside a good university library.

As Ian Jackson suggested a parallel inductor might work....this modifies the parallel resonance. Ian..is there a schematic available for that ? I'd be interested in what actually worked.

Steve

I'd like to get close to 500ppm if possible.

I figured that they were voltage dividers to set the amount of feedback, but
I can certainly see how they could have an effect. Since I'm close to where
I need to be, I will try a couple of 33pF caps to see what happens.

I understand now. I knew that adding capacitance tended to slow xtals down.
I was unfamiliar with how an inductor would act in series. I knew that this
circuit was trying to pull the crystal higher than spec so I, quite wrongly,
assumed that the inductor would have the opposite effect of capacitance.
And it seems that it does when used in parallel and that seems sensible to
my feeble mind. But in series, it has the opposite effect. What still
throws me is that raising series capacitance doesn't have the opposite
effect of adding parallel capacitance.

Hmm....food for thought. :-)

Doodling with reactance formulas, it appears that 20uH (coincidence?) would
offset 100pF of capacitance fairly well by having a an opposing reactance
(well resistance at this point) of about 450 Ohms at 3581kHz, the same as
100pF. I'll try putting the coil I made in parallel and see what happens.
Hopefully it won't short the oscillator and kill my 15 year old NE602, I
only have two spares.

It's just inductive reactance, I need more coffee. ;-)

Should I be afraid to do this? Does it need something to block DC current?

Wow.  Message received.  It'll be fun to disassemble a microwave...when
I was a pre-teen, I used to do it to old 1st generation TV's  the best
part used to be imploding the picture tube.

Thanks!

John

do you need that much ?
what freq you need ?
whats the colourburst crystal freq ?

no they are involved in setting the frequency too,
in order for you circuit to work it needs to resonate,
with the 2 100pf the input where the crystal is looks like a capacitor with
some negative impedance,
the circuit with your crystal, inductor, and trimmer must be inductive,
it then forms a resonant ciruit with the capacitance of the input.
usualy the crystal would just be operated so that it looks inductive.

the negative part of the input impedance must be stronger than the loss in
the tuned circuit.
this is affected by the ratio of the 2 100pf capacitors.

a crystal can apear to be a very high inductance at resonance,
at the point where you want to operate it probably has very high inductance
indeed.
you can determnine the eqv inductance by using the equivalent internal
inductance and capacitance. you need to find the mutual capacitance of the
crystal wich is hard to find man specs wich tel you this but it is often
something like 14ff for example.
(0.014pf) you can then work out the eqv series inductance for it to resonate
with the std load wich may be 20pf.

you can then work out what inductance the crystal will apear to have at the
frequency you want. and hence the series capacitance you need.
you might find the inductance is so high that you need less than 1pf or it
has become capacitive.

Google "Telstar Electronics" and you will see that he already has that problem. He seems to apply his 'head-in-the-sand' business methods to all aspects of his business. He thinks that living in his parents' basement will protect him from legal responsibilities, but here again he's ignoring the fact that running his scams out of their house makes them partially responsible, both legally and financially. His blatant disregard of civil responsibility is enough to bring up the question of what else he's doing in that basement for a quick buck..... making bomb timers for terrorists?

Wild guess: in pentode mode, a PP pair of 813's in AB1 needs approx
160 v peak-to-peak to develop 250 watts of power.

15 watts at 4 ohms is about 20 volts peak-to-peak.

So you need a voltage step-up of 8 or more, round up to 16 for a little headroom. Don't round up too much or you'll lose some current ability. If you're looking for impedance ratios they are voltage ratios squared, so 1:64 (250 ohms, sounds low) to 1:256 (1K ohms, about right). Note that 600 ohms is a commonish value, you're in luck if it has a center tap!

As a sanity check, typical 811A (high mu triode) class B pairs take about 10 watts at 1000 ohm impedance for driving too.

Generally the voltage ratio is more relevant than any impedances printed on the transformer. If you find a hi-fi or 70.7V PA transformer that's great, but lots of people have pressed filament transformers into use too. A center-tap on the output side (even if it's really the input side!) is really nice, you'll note that "international" filament transformers have two 120V windings that can be put in series for 240V or in your case to make a center tap.

My question for you: what kind of modulation transformer do you use to drive the plate for the 8000? I'm jealous that you apparently had one just sitting around :-).

Tim.

I vote for the 4 way resistive splitter
http://www.microwaves101.com/encyclopedia/resistive_splitters.cfm fed
with lots of ergs from a gently tickled Xtal osc and sutiable
buffering. Terminate each limb in 50 ohms near each 605 and feed with
50 ohm microstrip from the central distribution point (buffer).

Jack,

I agree with Tim's comments, and will add just a few words.

One concern I have is that the 15 watt amp will see a load of varying impedance from the 813 grids. If you are running them Class AB, their input Z is near infinite until grid current flows. That reflects back to the 15W amp, which may or may not affect it.

I suggest putting a resistor across the secondary of the driver transformer, so the amp always sees a load. The resistor then sets the impedance of the transformer.

Some back-of-the napkin numbers:

As Tim says, 15 W at 4 ohms is about 20 volts peak-to-peak. To give some headroom, let's use 10 volts.

Again using Tim's numbers, figure about 200 volts peak-to-peak at the 813 grids. That's a 1:20 voltage step up, or a 1 to 400 impedance step up.

The output Z is therefore 1600 ohms or so. The resistor should be 1600 to 2000 ohms, 20 W. Could be a bunch of smaller resistors in series-parallel. The 20 W rating is very conservative, too - 10 W may be enough.

Besides the transformers Tim mentions, keep an eye out for Stancor "rectifier transformers". These have been around forever, and have the numbers ranging from RT-201 to RT-208 or so. They are all the same windings, the difference is in the power rating. An RT-201 is more than enough VA for this application.

The RT series are well-documented, common and not too expensive, and
have the desired dual primaries (which you use in series to drive the
813 grids). They also have lots of secondary taps so you can try all
sorts of ratios.

No such luck but I did find someone else by trolling who did. It's a
UTC SS22 and about right for the job but I would feel more comfortable
with something a little bigger.

I only need about 200W of audio but I would like to run it at 2000 volts
to get legal limit out of the final but I am a little reluctant to push
the mod trans. I am currently running at 1600V and everything is happy.

There is some idling grid current flowing.. about 30 ma if that helps any. This is a zero bias set up with screens and grids tied together.

> I suggest putting a resistor across the secondary of the driver

Someone else suggested a resistor in series but I forgot why. Are you addressing the same problem?

> One request for your website: MORE PICTURES!

Thanks but I have been doing a Photo of the Week this for 12 years and that's about 624 to date. If you just want to fall asleep watching them, try the slide show.

> ...that 8000 is just beautiful, btw...

Very satisfying to turn a bookend into the heart of a real transmitter.

It is a standard method of distributing multiple PA or music speakers
from an audio amplifier. If you start out with a 100 watt amp with a 100
watt/70 V audio output transformer you can run small gauge wire to the

remote speakers. At each remote speaker a 70 V transformer steps down to
the speaker impedance by way of a tap corresponding to the power you
want delivered to the speaker. If you have 10 speakers, use the 10 watt
taps etc.

That must be some kind if americanism, since I have only heard about
100 V lines, for distributing audio power at a reasonable level around
a large house,

If you have Microsoft Streets or AutoRoute, you have all you need for
live APRS tracking. You can now take advantage of the superior maps
that comes with it and use it with APRSPoint. We have update the
installation process of APRSPoint so that it now supports Streets or
AutoRoute. You can visit http://www.aprspoint.com for a free download

and trial.

Well I take the original poster`s point, but it`s a case of "use it or lose it" and the more people that use the bands, the less likely it is that they`ll be taken away. So even if they are worked by wankers, at least the wankers are serving some purpose. Plus there is nothing to stop code lovers (of which I am one) from continuing to dit-dah away indefinitely. No one`s proposing to make CW illegal. Let`s try to be a little less elitist, gentlemen!

Hi chaps,

I suspect a neighbour of a friend of mine is using an ultrasonic bird-scarer to frighten off his pets. The man concerned won=B4t admit to it, but there are times when his dog and two cats just seem to get suddenly very distressed and hypermanic for no apparent reason. I`d like to at least eliminate this possibility before considering any others. So the question is, what=B4s the simplest way to detect ultrasound? My web research leads me to believe the area of interest is between 20 and 30khz. Most common bird scarers warble between these two limits which are of course above the range of human hearing. I=B4ve acquired an ultrasonic transducer that transmits on 41khz. If I couple this up to a wien-bridge oscillator trimmed to the same frequency, I figure I ought to be able to hear a warble if indeed this guy is using a birdscarer, because the difference between 41khz and 20khz-30khz will be audible to me. Is this feasible to "air mix" the two frequencies in this simple way and hear a result, or is something more complicated required?
Thanks!

Interesting.

The mixing process requires a non-linear device, which, for your purposes, I suspect the air is not. I've often considered, but never attempted, a similar mixing process using human ears (connected and intact, of course), since ears are quite non-linear. Ears won't work as mixers in your case since, at least for most adults, they are insensitive to ultrasonic frequencies (as well as to intelligent political analysis, it seems).

The suggested bat detector is far more promising.

Chuck

Why worry about it... His yard, his pets, his life...

OK,

Take a microphone with a frequency response > 30Khz, and an amplifer.
Monitor the amp's output with a scope. <bg>

Suspend a thin shaving razor blade between two pieces of dental floss and put your ear close to the blade. Watch the razor vibrate.

Hi every one!

I'm currently working on a project using SA602A with a 32MHz crystal
oscillator. The crystal is specifed with 30 pF load capacitance. I'm
not able to make the crytal works. I use 120p and 40p in series, for
the crystal.And I follow the circuit given in SA602A data sheet for
cellular radio application. Can anybody help me with this one,
please..Thanks

Yes I did, but, what about it? i think it does not give much
information for components to be used for the oscillator

The SA602 oscillator ir primarily intended for fundamental mode crystals.
Your 32 mhz crystal is probably a 3rd overtone unit. It will probably
require a tuned circuit to ensure that it comes up on the third overtone and
not on the fundamental frequency. I recall that the Philips app note shows
how to do that.

That's pretty cool, MacGuyver. Does the razor blade do anything?

The obvious "detection" would be oscilloscope observation of the amplified microphone signal. That's been mentioned.

Some commercial ultrasound detectors simply heterodyne the ultrasonic range down to audible frequencies...good if your hearing goes on up to the high end of human response. Expensive as portable devices but easily genned up on the average home workbench.

There are a couple of claims of outdoor advertising via sound through using high-power ultrasound generators in pairs, one modulated in amplitude the other unmodulated. The air acts as the non-linear "mixer" and the claim is that such beams of ultrasound can be focussed on particular locations. One such company is located in San Diego, California, if memory serves.

To get the air to be non-linear enough to mix the two frequencies, you would need very high sound pressure levels that could potentially be hazardous (or at least much more of a nuisance that whatever your neighbour is doing). I would suggest getting a wideband microphone (a very small electret might do, and would be less high-Q than a typical ultrasonic transducer), and then attach a preamplifier and an electronic mixer with an adjustable local oscillator (e.g. make a bridge from switches using a 4066 or FST3125 that alternately inverts or doesn't invert the signal). The output of the mixer can be fed to an audio amplifier and headphones. You can then test this receiver if you buy or borrow one of those cheap "pest annoyer" things. Once you know that your receiver works, you could make a parabolic reflector (e.g. spin cast a dish on an old record player from plaster of paris in a bin lid), so that you can search for sources of ultrasound.

Chris

I have now a Wagon R car. It has two front air bags.
Are they likely to be set off by ten watts at 145MHz.
Is it safe to have mobile amateur radio and air bags?

Replace the dental floss with Litz wire and attach ends to 110 VAC.

Wait. Maybe not. Considering how many stations you can pick up with a razor-blade radio, that would probably interfere with vital communications all throughout the spectrum. What's the resonant frequency of a whisker?

> Hi chaps,
>
> I suspect a neighbour of a friend of mine is using an ultrasonic bird-scarer to frighten off his pets. The man concerned won=B4t admit to it, but there are times when his dog and two cats just seem to get suddenly very distressed and hypermanic for no apparent reason. I`d like to at least eliminate this possibility before considering any others. So the question is, what=B4s the simplest way to detect ultrasound? My web research leads me to believe the area of interest is between 20 and 30khz. Most common bird scarers warble between these two limits which are of course above the range of human hearing. I=B4ve acquired an ultrasonic transducer that transmits on 41khz. If I couple this up to a wien-bridge oscillator trimmed to the same frequency, I figure I ought to be able to hear a warble if indeed this guy is using a birdscarer, because the difference between 41khz and 20khz-30khz will be audible to me. Is this feasible to "air mix" the two frequencies in this simple way and hear a result, or is something more complicated required?

> Thanks!

You need your detector to be low Q since you don't know the offending frequency. Some of these fancy sound cards do 196kHz sampling. A piezo microphone with amp into the sound card might do the trick.

Also, as other have suggest, the bat detector.

Do you really want to hear it, or have a "field strength indicator"/locater?

Why not just a mike capable of "hearing" the ultrasonic freqs in question--feeding an opamp and meter?

Pointing the mike around should lead you into the correct direction and following the meter reading should lead you to the source(s).

Possibly can substitute a light or even a led in series with a pot and
use a visual indication of strength ...

Come to think of it, wouldn't take much more to square up the sine wave
out of the opam and drop a cmos decade-divider onto that output of the
opamp and feed an ear phone with the dividers output--30,000 becomes
3,000 hz--easily "hear-able!"

Hi Pete.

I have used various handies upto 10w output on 2meters and my IC2800 puts out 50ish on 2 (ant mounted on the roof about 6cm from one of the bags explosives!) and my Toyota Yaris has had no problems with any of its 9 airbags (10 if you count the missus!) so I would say go ahead!

only if theres no other sound present in the mic signal.

and it will give no indication of signal amplitude.

Never even thought about it.
I run 50 or 160 out on 2-meters and 35 watts on 440 in a Toyota
4-Runner. The dealer ran the wiring for me.
My wife's set up in the Prius is a Kenwood TM-V7A with 50 out on 144
and 35 on 440.

I *think* what the OP is worried about is that his friends' pets are being scared off by his freinds' neighbor.

While I hate to discourage anyone from building something electronic, I do have to ask: what will one do if they learn that a bird-scarer *is* in use? Best of my knowledge, they aren't illegal.

If a bird-scarer works on dogs, then I find the details quite interesting. May have to work up a mobile version. Loose dogs allowed to roam a neighborhood are a serious safety issue for cyclists. (and I wonder if that's why the neighbor in question is trying to scare them off?)

Could not have said it better and your comments mirror my sentiments as well. Thank You

If we are to have fun and let this hobby flourish, we all need to work together to make it a model of humanity and acceptance. Just because one has passed code reception tests at some level does not make him/her the exemplarily model of the perfect ham. Look at all the child like behavior resulting in massive FCC fines of the past five years! These were all 'coded' hams. Some with 20WPM test behind them. Remember, we (the US) are one of the last to continue to have had a code requirement. Has the 'hamming' rest of the world gone to heck in a handbasket? No.

If you find it difficult to deal with the no coders, then it may be time for you to move on to another hobby. I welcome the 'new blood' as this will ensure our bands remain ours and might even cause equipment prices to come down - it's all in the law of supply and demand.

Of course it's radio. You'll find that if you aren't radiating a signal, there's no signal and it's not radio. Otherwise, it's radio. And that means licensing and all the rest.

And there's a good reason wifi is higher in frequency. Because the bandwidth is there, to allow for multiple signals. Likewise, the shorter range means losts of points can reuse the same frequency, because the range is quite limited. And of course, the higher the bandwidth of data, the more radio space it uses.

Move to a lower frequency, and you'll have less chance to control the signal. You may find there's too much interference to other users. There may not be enough radio bandwidth for everyone who wants it.

That you don't realize this would be radio is a good indication, like someone else suggests, that there is no solution for you because you don't have the grounding to go anywhere with it.

Several things come to mind here:

Quantity vs quality we hear a lot about. The former is good for publishers and equipment manufacturers and the latter is good for interesting QSO's.

Someone mentioned the importance of ham radio as a service to the community. What makes ham radio so special that it has to be a service to anyone other than those who enjoy it? All such justifications are pure nonsense these days.

It is also frequently said that ham radio is an "old man's hobby". So what! There are plenty of hobbies for children. I for one enjoy getting away from teeny boppers.

I get a great deal of pleasure out of talking to people my age and exchanging experiences and how we got here. I have nothing in common with children. I would be delighted to elmer them but competing with computers, cell phones, drugs and teenage girls is beyond the call of duty.

I welcome them into the community but to go trolling for them is a waste of energy.

People complain about the crowded bands, QRM, rude behavior and yet whine about declining numbers.

Won't it be nice what all that open space on 75 is filled with CB level hams?

JACK K9ACT since 1955

p.s. check out the POW for what "old men" can do :)

TO: All People Who Care

A new European Chemical Testing Policy called REACH has now been finalised by the European Union. Under these proposals Chemicals of every kind - from those used in industrial processes to the ingredients of consumer products - will be tested on Millions of animals from mice to fish to dogs, causing untold suffering.

Still worse, because of this reliance on outdated animal techniques, reliable and relevant information will not be provided and our safety will not be assured.

If you believe that REACH should make more use of Alternative Testing to test 1000s of Chemicals that have been in general use since before 1985 then please take action now.

If you are a European citizen please contact your local papers and own MEP asking them to promote the development of humane non-animal testing methods under the REACH legislation, which is the best hope we have for sparing animals the misery of a testing laboratory.

A sample letter can be found at the BUAV (British
Union for the Abolition of Vivisection) website at
www.BUAV.org (Select Campaigns, Chemical Testing,
Get Active then Writing to the local press).

For all Non-European members, you can still help.
Please tell all your colleagues and friends in the UK
and Europe about REACH. Write to your own local
papers to try and inform others about what is going
on in Europe.

The website for the European Parliament is
http://www.europarl.europa.eu.
Information on REACH, the New European Chemical
Testing Policy can be found here.

Everyone can help and you can make a difference.

Thank You

The whole reason there's a problem is that there aint that many users.
If there was, DSL would be here. If you drive from Little Rock north
thru the Ozarks up US 65 twards Springfield MO, most of the time you
can use your cell phone. But get 20 miles east or west of that string
of transponders, and its dead even if you are on a mountain, never
mind behind a ridgeline, much less down in a creek bottom.

For right now, there arent any other users. And even if I get this
developed and working, there wont be that many. The population density
is low. The biggest town in Van Buren county is Clinton, pop 3000, and
in Searcy county Marshall, 1200. And if you drive from Clinton to
Marshall, the only town is Leslie, pop 627. Moreover, if you drive up
US 65 from Leslie twards Marshall and hit the search button on your
FM, it'll find the Christian fund radio station in Marshall. Hit
'search' again, and it'll find.... the Christian fundy radio station
in Marhsall. There is dead air all over the TV and radio bands out
here that nobody is doing anything with, nor will they ever.

Bring a portable TV up here, and the rabbit ear antenna will find two TV channels: 4 & 6; and if you come down off the ridgetop, only 6. I got a 12ft boom Yagi on a 25' mast on the top of a ridge, and all I can get are 2,4,6,7,11 in watchable condition. 16,20,38,42 are too snowy to bother with. Anyone who wants to watch much TV or listen to the radio gets a satellite dish.

I'm only 6 air miles from Clinton, but the ISPs to hook up to are all in town, down in the valley with a mountain to get over. CB radio at 27mhz can bend down in there, but anything over 100 mhz looks dubious. Leslie has an ISP up on the side of a ridge, that would be close to line of sight, but I'd havta clearcut about 14 miles of timber to get thru unless I get down to 400 mhz which has a wavelength longer than wet pine needles. Even if I could get over that, the pine grows about 18"/year.

One of the reason folks live out here is we like the woods; there's a lot of it. National & state forest, game & fish land, transnational paper loblolly pine plantations and our own private woodlots. None of the commercially available transceivers can punch thru it all, especially when its wet. Looks like there's a problem with my Hughes.net satellite dish when it gets wet too. I called after the last hard rain, over a week ago, they said they'd get a service rep right out. I heard from him on thurs finally saying he'd be out next tues. Its a hundred mile drive, so its not somethign they like to do often.

I need a piece of equipment I can maintain myself and deal with the server end when I go to town shopping. Its only been in the last 5 years that Alltel in Searcy county replaced *rotary dial* with touchtone. Til then, the "Welcome Home" community fire dept had a party line. If you know what that is. The sheer backwardness of many rural areas makes low frequency transceivers necessary. I dont blame them; its damn expensive to bury cable when you need 3000' foot per customer. When I first got on line, I hadda run a mile of my own cable.

With 12db tuned yagi on each end, I should be able to cover the distance with only a few watts. It aint like it'd be walking on anything anyone else had, and it aint like the FCC is gonna bother sending agents all the way out here to try to find my setup. They couldnt even find jerks in major metro areas putting 1000 watts on a CB channel. We usta hear them walking all over our own neighborhood rigs in the woods.

All the folks in town have DSL; that leaves only maybe 15,000 spread out over 1250 sq miles of hills. And of those, with 4/house, less than 4000 PCs that mite possibly want to be online on about 200 acre farms each. Scattered in all directions. With the directionality of tuned Yagi, nobody would be interefering with anyone else's signal. Arent there notch filters that only accept a few megahertz? And pulse detectors that'd recognize clipped sine wave peaks for zero and the normal amplitude as one?

> Hi Janne,
>
> I and Q each contain all received signals, and unless your ears are better than mine you can't really tell whether you're listening to I alone, Q alone or the full demodulated signal. I and Q are needed together to determine whether the signals demodulate into the upper or lower sideband, so if you have signals spread equally across the band, listening to only one of the channels will fold the upper and lower sideband signals together and you will receive twice as many signals in a given bandwidth. This is the same as a simple DC receiver. Note that your spectrum display will be symmetrical about the baseband frequency if you disconnect one channel--all signals appear twice--in the upper and lower sidebands.
>
> In theory, I and Q each contain half the received power, and if only one channel is present you spread the 3 dB reduced power to two places (upper and lower sideband) so you will see a 6 dB total loss with respect to the fully demodulated signal when you disconnect one channel.
>
> AM and FM demodulation can be done in software regardless of whether the signal is mixed to a higher audio frequency (say, 11 KHz as some SDRs do), or mixed right to baseband. For AM at least, the demodulation algorithm is probably a little simpler when mixed to baseband. For FM likely the opposite is true.   Once you understand the nature of IQ demodulation a little better the AM and FM demodulation algorithms may become self-apparent to you.
>
> 73,
> Glenn AC7ZN

Hi Glenn!

First of all, thanks for the really nice and informative reply.

So basically, what you are saying, is that we only need I or Q to demodulate AM or FM. Is I and Q then only needed to cancel out the other image ? What I would still like to know is, does the same 6 dB rule come in at the case of FM and AM ?

This area of ham radio is one of the most exciting things I've been playing with. I started with earlier mentioned polyphase network receiver few years ago and that encouraged me to go further. Yesterday I tested the TX of my SDR and it worked immediately, giving out 85 mW with nothing else that the exciter itself to a 50 ohm resistive load. Very impressive!

Thanks,

Janne - OH1GTF

Save yourself alot of bother. Buy a 'power strip' and plug it into your UPS.
Viola! Extra backed-up sockets.

What you really need to do is to convince your local power company to do what Israel Electric did. A long time ago they figured that BPL was not worth it, but their right of way was. So they ran a fiber optic network along with their power lines and use it to monitor and control their distribituion equipment.

If they ever can get a license to sell Internet access, then they can just use the fiber optics.

As for the local telephone company just upgrading from dial service, isn't there a fairly large tax in the U.S. to support providing telephone service to rural customers? Where did that money go?

Geoff.

hallo

It seem to be a issue
to the famous TV serie mythe busters
Seen the amount of respons it seems to be a hot item
i like discusions to learn things and broading my range of vision
also to know people of other backgrounds

can amateurradio blow up cars and/or its equipments ??

the today cars are crammed by electronics,sensors boardcomputers etc
is this equipment BCI free a simple case of BCI may casue a serious accident
by blocking a aboardcomputrer.
who is responsible the cars industry by ignoring the bci problem
or is the transmitting ham

Nelson's question does bci in cars exist ? Yes it does many examples
even trafficligths included

It seems to me that manufactories know the bci problem.often pcb's have
already holes for the needed components who is responsible

The bci problem has a profit too!! I live opposited a snackbar yougsters in
their cars equiped with stereo amp's   loadbawlers and their 130dba
bonky bonk music
A 100watts carrier stops that (not always)

nelson asked what 's the fieldstrength   of RF that effects carequipments
I have heard that a resaerch institute somewhere in SM or OZ has discovered
a strange effect into a TV set sensibillity to bci and tvi was tuned to the
amateurbands by manufactor !!
So the radioamateur had to solve the problem and not the manufactor !
I hope to see your response

Hallo you ll'
Again a nice discussion and a lot of aspects
CWing or not or another information code
From historical point of vieuw CW is the oldest and in my opinion the

reliablest
and CW was a boarder between HF and VHF
caused by brain damage i can concentrate on the recieving dittery dah dit
of the morsecode
 and so became the morsecode a boarder betweem different kinds of
radioamateurs
practice cw was a license the use unmanageable power
practice cw became the roots of the QRPers
CWers became a elitegroup of amateurs however they did nt understand the
basic goal
after cw proof they rapidly forgot the code and have boasting on DX
and when they met an antenneaproblem they let solve their problem by the
techinical VHFers
SO be a "better " amateur however what is better contacting or
understanding

Hi Janne,

Yes, IQ receivers are fun. We typically use the complex frequency
domain to describe their operation, and in that domain they are very
elegant.

I just want to correct a misunderstanding: I or Q alone are not sufficient to demodulate AM or FM except in the special case of AM mixed so the carrier amplitude and phase are exactly at DC 0 volts. You need both I and Q together just as you do to reject unwanted sidebands in other modes.

My previous post was meant to say that it doesn't matter if you mix an AM or FM signal to baseband or to some audio IF such as 20 KHz, as long as you have both I and Q a software algorithm to demodulate it is possible.

73,
Glenn

Sorry about not deleting unnecessary stuff in the last post--

AM and FM behave the same as other signals in an IQ receiver and if you use I or Q alone they have the same 6dB loss I mentioned. You can receive and demodulate AM and FM using only I or Q alone, but just as with other signals you need both I and Q together to be able to reject the unwanted mixing sideband and to recover all the power from your desired signal.

> FM is done?

I and Q give you phase information; sqrt(I^2+Q^2) gets you the amplitude of the signal. Now... AM is not phase-modulated, right? So **assuming you can synchronize your carrier to the incoming carrier**, "I" will be the original signal and Q will be zero, so sqrt(I^2+Q^2)=I --> poof, only I needed! If you chose Q, you'd just get zero (ideally) out of the receiver... but since you're presumably in control of the local oscillator, you can just advance or retard it 90 degrees and now Q is in-phase with the signal and I is zero. Hence AM can be made to work with either I or Q... although it's not really recommended, since -- if you have an IQ demodulator anyway -- you can build SSB receivers as well, which is useful.

The tricky part is that "synchronizing to the incoming carrier" bit: If the receiver and transmitter have the exact same frequency but phase offsets of X degrees, the result is that I receives the original signal mulitplied by cos(X) and Q receives the original signal multiplied by sin(X). (This is just the general case of what I described above where things were 90 degrees out of phase.)

Notice that phase and amplituide, while connected by phase=arctan(Q/I) and amplitude=sqrt(I^2+Q^2), are two separate, uniquely "identificable" "things" that you can transmit. This is taken advantage of in, e.g., "compatble" AM stereo broadcast standards: In Motorola C-QUAM, for instance, I is set to 1+L+R whereas Q is set to L-R. If you run through the math, the amplitude of this is not 1+L+R, but it is "close enough" if L-R is relatively small, and hence compatibility with traditional (envelope) receivers is maintained, while allowing a synchronous receiver to dig out the full stereo information.

There are plenty of solutions presently available, you're just saying you don't like the price tags attached. That's understandable enough -- and there is certainly money to be made if you can come up with cheaper solutions.

> Right now, I'm using the satellite data from hughes.net. Its not the

If you call them up and offer to pay lots of extra money, I'm sure they can fix this for you. :-) Still, satellite bandwidth is expensive -- even the military tries hard to avoid using them except in situations like yours, where there simply is no other easy way to get data in and out of a remote area.

> outlets. Hello?

You can get short (~6") "extension cords" that fix this problem (see: http://www.cyberguys.com/templates/searchproducts.asp?categoryID=35), or you can get a power strip that has some of outlets spaced for wall warts. Almost any store today will carry those.

> I've tried the 900mhz wireless transceiver. which needs a clear LOS
> (Line of Sight).

Only to get the maximum range. :-) Granted, the difference in usable distance between LoS and "straight through a bunch of trees" could be 100:1.

> I like living in the woods; and I'm not going to
> clearcut just so I can get a clear line of sight to the ISP
> transmitter tower. Hello?

ISPs are a business; they're not going to provide some "alternative" solution for your needs unless they think they can make money off of you. This is one of the things you have to accept when you chose to live in a remote situation -- *everything* gets more expensive, and some things -- like high-speed Internet access -- do so quite disproportionately (you know, this is kinda why the whole idea of "towns" was invented in the first place? :-)). Think back to only 10 years ago, when trying to get a 3Mbps Internet connection in a big city would have run thousands of bucks per month -- today it's about $55!

You might write your local senator or representative and ask that they pass some "rural high-speed Internetification act," but I wouldn't get my hopes up. :-) (Like the REA many years ago...)

> Besides, seems like there mite be pulse emitters/detectors that work
> at this speed. No Carrier wave, no IF. Technically, its *NOT*
> "radio".

It doesn't matter what you call it, the FCC regulates it. The pulse systems you describe are similar to how UWB (ultrawide bandwidth) radios work, and they're very much regulated by the FCC.

> I guarantee you that if you start transmitting high-speed pulses and a high
> enough power,
> Ordinary tuners would ignore it; it aint AM nor FM.

This is highly unlikely: A high enough power pulse will certainly show up as interference to any other radio system, even if it is just a brief "scratch."

> A 12 db
> antenna would be about 13' foot long. Awta go 30 miles to an ISP in
> some town that stays up serving users on the weekends. I've tried all
> three of the local small town ISPs, which have a nasty habit of
> crashing on friday nite, and not coming back online til monday
> morning.

Well, hey, more power to you if you can get it working... but don't coming crying to us if the FCC does hit you with some huge fine or a group of vigilantes spikes your coax and blows your transmitter.

> I called "support" one time to bitch, and mentioned that I used Linux.
> The response: "What's Linux?"

That's not surprising. Especially in a rural area, I suspect the number of Linux users is probably well under 1%... you might as well have called them up and asked if you could use your Atari ST with their services.

> But what's the best option to go from full duplex into the PC? will
> the standard LAN multiplex at 180mhz?

Define "standard LAN?"

In general protocols like Ethernet perform poorly when connected directly to wireless links: Being originally designed for wired systems, the protocols assume a very low bit error rate, which is exactly the wrong assumption to make for a wireless system. Hence, the throughput tends to drop like a rock unless you have a completely "solid" link.

I think you'd be best off doing the following:

1) Lose the attitude. It isn't helping you and just turns other off; you'll receive much better responses if you simply state your situation and what you're after rather than disparaging so many things, even if they do deserve it (save that for after it's all working and you're kicking back with your friends at a bar).
2) Plan on building yourself a tall tower such that you can mount a microwave dish on it and hit a tower back in town. With WiFi at 2.4GHz, 30 miles is probably a stretch, but at least you'll find there's a *lot* of support for people doing it... and the equipment to do so is reasonably inexpensive. You'll still be looking at thousands of dollars here -- perhaps >$10k --, but if you have a, say, $250k home, just pretend it's part of your mortgage. :-)
3) Start visiting the nearest neighbors you *do* have. Many of them would probably be interested in high-speed Internet access as well, and many would be willing to contribute financially to your cause. Additionally, you might consider doing some "mesh network" sort of approach, so that your signal only has to make it to the next house, which relays it to the next house, etc.
4) If you get an amateur radio license (quite easy these days), you can legally start pumping enough power at 2.4GHz that 30 miles will become easy.

This makes your Internet connection easy, although it then subjects the content of that connection to all those amateur radio rules about not using it for fiduciary gain, encrypted communications, etc. Many people will not be unduly restricted by those rules (it's still OK to, e.g., buy stuff from Amazon.Com... at least if you avoid the https: site? -- it is a little dicey here).

Good luck... let us know how it goes...

Or it takes no real skill to go to the hardware store, buy a cheap extension cord, and a replacement plug, then cut down the extension cord and put the new plug on the bare end of the short pair of wires that go to the female end of the extension cord.

Of course, I only started doing that after I was using a full length extension cord, that I carefully rolled up and tied. Actaully modifying the extension cord was just to make it cleaner.

If you have frequency lock but not phase lock, the phase detector in a phase locked loop will output a DC voltage proportional to the phase difference. When using the Q multiplier as a phase detector, just adjust the oscillator phase to bring the averaged Q output to zero and you will get the demodulated signal from the I multiplier.

Costas loops have been used for AM detection, so you might find some ideas from that direction too.

For usable throughput at reasonable power you definitively need the LOS path.

To get LOS, all you need is to move your antenna high enough. Towers up to several hundred meters high are available commercially. Less reliable solutions are flying the antenna under a kite or a balloon.

If this is too expensive, I would suggest moving to a more densely populated area. You will have to find an optimum for the cost_of_land + cost_of_telecommunication.

As others have suggested, it might be enough if you have a LOS path to your neighbour and they have a LOS path to their neighbour and finally one neighbour have LOS contact to the ISP.

One other solution would be to move a repeater to a hilltop visible both from your site and from the ISP, but there is the problem of powering it. Solar cells might be an option, unless you live North of the Arctic circle or the sky is cloudy all the time.

A passive reflector at the hilltop might also be possible, but this will require very narrow beams, which will require large antennas at both ends of the link, in practice in the upper microwave bands or even IR or visible light. However, at these frequencies clouds etc. will disrupt the communication.

>synchronize your carrier to the incoming carrier**, "I" will be the original

>signal and Q will be zero, so sqrt(I^2+Q^2)=I --> poof, only I needed! If you chose Q, you'd just get zero (ideally) out of the receiver... but since you're presumably in control of the local oscillator, you can just advance or retard it 90 degrees and now Q is in-phase with the signal and I is zero. Hence AM can be made to work with either I or Q... although it's not really recommended, since -- if you have an IQ demodulator anyway -- you can build SSB receivers as well, which is useful.

Good post, Joel. Let me emphasize some more simplistic points for other readers:

BOTH I (in-phase) and Q (quadrature) carry the SAME amplitude variation as modulation, ergo the AM information can be taken from either one if desired.

Selection of sideband for AM uses the phase DIFFERENCE between I and Q that, combined with a wideband audio relative phase-shift network in a linear (algebraic addition/subtraction) mixing circuit (just op-amps), selects the desired AM sideband.

>The tricky part is that "synchronizing to the incoming carrier" bit: If the receiver and transmitter have the exact same frequency but phase offsets of X degrees, the result is that I receives the original signal mulitplied by cos(X) and Q receives the original signal multiplied by sin(X). (This is just the general case of what I described above where things were 90 degrees out of phase.)

Heh, heh, while a concise statement of what it is, the above is going to be a snow job to those not familiar enough with more-advanced math. I know it got me a few decades ago and I just finished explaining that to another last month (off-line with the advantage of some scratch paper to show the relationships).

Locking the AM carrier to the local detector sub-circuit oscillator can be done by simply running the whole IF signal into a LIMITER to blot out the sidebands. The resulting limited carrier is then used as a reference to lock the local (detector) oscillator. "Lock" may be simplistic since the old Motorola MC1330 video detector simply limits the carrier internally, uses a single L-C external circuit to keep the internal I and Q references at quadrature, and the two internal "product detectors" output is linearly added internally. Blessedly simple circuit, just one 8-pin DIP and a very ordinary L-C that isn't critical in tuning. I used that in a bank of 8 pulse detectors having carriers up to 62 MHz with no problems (even crammed into a thin space).

FM detection by similar, but NOT identical means, to AM. The modulation equations for FM and PM don't allow that similarity since sideband content is not really close to AM. That is done in the more familiar "ratio detector" or "quadrature detector" (sometimes an alternate name)

found in consumer electronics SOCs for FM receivers.
Try as I might this morning I couldn't put together a
text-only simple description of how that critter works. :-(

"Synchronous detection" of AM can be done on the same
model of the internals of the Motorola MC1330 IC with,
perhaps some more finesse applied to the detector's
local oscillator to remove some of the noise on low-level
input signals; not a terribly-important thing nor precise
since the oscillator's lock DC signal can be lowpassed
to around a half-second time constant in the loop filter.

>Notice that phase and amplituide, while connected by phase=arctan(Q/I) and

>this is not 1+L+R, but it is "close enough" if L-R is relatively small, and
>hence compatibility with traditional (envelope) receivers is maintained, while
>allowing a synchronous receiver to dig out the full stereo information.

C-QUAM follows the FM Stereo system where the demodulated
audio is the sum of Left plus Right. One hears (directly)
both sources for monophonic audio. The supersonic audio
carries Left minus Right audio. Linearly added and
subtracted, the Left plus Left and Right plus Right gets
the individual "ears" separated. The C-QUAM audio does
have a slight stereo distortion on odd selective conditions
that favor one sideband over another locally, typically
the effect of electric power distribution lines close to
the receiver site. Typical on my particular street. :-(

Many textbooks and professors tell you the "bad news" about a phase difference and that unwanted cos(theta) term... but they seldom mention that what "I taketh," "Q giveth," and that you haven't actually lost anything yet -- if you have both I and Q available -- just because you aren't phase-locked. I suppose this is because, at that point, most textbooks are still hundreds of pages away from discussing I-Q methods.

A lot of the texts make quite a mire out of the whole "arbitrary band-limited signal impressed upon a carrier" bit. I think most people are almost better off ignoring it initially (it seems to come up within the first few chapters in many texts!) and then coming back to it once they have a good "feel" for how phase modulation techniques work.

> What you really need to do is to convince your local power company to do what Israel Electric did. A long time ago they figured that BPL was not worth it, but their right of way was. So they ran a fiber optic network along with their power lines and use it to monitor and control their distribituion equipment.
>
> If they ever can get a license to sell Internet access, then they can just use the fiber optics.
>
> As for the local telephone company just upgrading from dial service, isn't there a fairly large tax in the U.S. to support providing telephone service to rural customers? Where did that money go?

Alltel used the money to put up the cellular transponders along US 65 & in Harrison, its largest shopping zone.

Compare the population density of Israel with the Ozarks. Lotsa folks beside me, still have property beyond the grid. That's much of why folks move out here; they want to get waaaaay back. There are lotsa places you can go outside at nite, and if you turn out the lites, its totally pitch black because there are no other lights in any direction. Lotsa folks own real estate entirely surrounded by National forest, family farms that were never bought up.

There are simialar regions in the Rockies. I even read about a 'net' that used packet radio spread across hundreds of miles of mountains. Canada, Siberia, Australia, and other regions are also way too thinly populated to afford anyone running cable.

we all know what lightning sounds like. The Titanic had a similar "spark transmitter", Not that different from the spark coil in a gas engine. I can see designing a circuit with a resonant tank to produce a pulse with a wavelength matching a tuned Yagi. No carrier wave. No frequency or amplitude modulation. And without being hooked up to a tuned yagi pointed in the correct direction, none of the AM/FM/TV tuners would pick it up. No IF either. A continuous train of pulses would look like a carrier wave, but that aint what *data* is.

If, for instance a "1" is a postive pulse, but a "0" negative, and the sequence of 0100011101010100110.... keeps changing, as it would with data, then tuners would ignore it. There's no sin wave. Zeners have been used in surge suppressors rated in nsec and I've seen sin wave illustrations of the circuitry in psec intervals. Seems like something mite be done.

Anyone know the data rate on the IR inputs on mthbds? Seems like the response time on IR diodes is pretty quick too... Feeding the mthbd with whatever came in an IR detector would islolate it from the antenna in case there really was a nearby lightning strike.

```

Of course, I already had the power strip. My point was that the power supply was designed by engineers who didnt think about where it would be used. I have other power supplies, like for the printer and scanner that have both input and output cords that dont crowd out anything else on your UPS.

And of course, part of the reason I ended up living out here was that it was so cheap. Even now, land can be had for less than 1000$/acre. Hardly any of the real estate ads are for homes & property over 250k.

Lotsa other old hippies in the woods who never made much money, never will, but we can afford to live here.

There's lotsa 34 ft TV antenna masts laying around behind the barns since folks put in the dish TV. Lotsa 12' foot booms for Yagis too, to be had for scrap metal prices.

I can see where you all with your licenses and equipment mite be worried about the FCC, but not out here. Its 100 miles to Little Rock if you wanna take a Ham exam. Why should the bureacrats runnin the FCC these days be any more competent than those running FEMA or The VA? And if I make this thing cheap enuf, there wont be any *money* in it for them coming out to get me. My ass aint worth anything, and I dont have clear title to the land. All they'd get would be 20$ worth of scrap metal.

Back when we used CB radios to talk to each other, we bitched to the FCC about jerks in urban areas putting *1000* watts on a CB channel. Where was the FCC then? No, man, out here, we are off the radar map. I dont expect any help from the Arkansas public service either. We dont have the votes, and we dont have the money, so they dont care what we do.

The way electonic parts prices have fallen, it'll prolly cost me more to put up the antennas. And without a tuned yagi, none of the commercial tuners will pick up anything. If anyone has a more appropriate forum to raise these questions in, I'd be grateful, and quit bothering you.

I very much doubt that -- it's much more likely they simply decided that saving a little money was worth more than adding a little user convenience.

> And if I make this thing cheap enuf, there wont be any *money* in it
> for them coming out to get me.

Again, I disagree. If you make it so cheap it really catches on, sooner or later it *will* be used in an area such that it intereferes with someone with deep pockets and you'll get sucked into a lawsuit. If you're going to so flagrantly ignore FCC regulations, you should simply publish *plans* for your design so that you can't personally be convicted of selling non-type-accepted equipment... unless you do want to have bars for windows for some time. :-)

> Back when we used CB radios to talk to each other, we bitched to the

The FCC does still routinely bust retailers for selling CB band linear amplifiers and rigs that can transmit outside the CB frequencies.

I still think your best bet it to use 2.4GHz WiFi gear linked "house to house" with cheap dish antennas on towers. Get that amateur radio license and you can legally run enough power that you'll easily make the distances, and no one will question why it is you're buying, e.g., 10W 2.4GHz amplifiers. Those dish antennas are probably going to be a lot cheaper than a bunch of Yagis anyway...

The FCC allows 4 watts EIRP for fixed point to point WiFi links. At 2.4gHz this is a lot of power, usually created by focusing the output of a regular router or similar device with a small dish or Yagi.

For example, the well publicised "Pringles Can" antenna can be easily modified to put out that much from a 100mw source. You need line of site, but if you figure a two routers, antennas, wires, etc can be purchased in the U.S. for less than $200, you can set up a whole relay system.

The latency will be much too high for VoIP and video conferencing, but websurfing and file downloading would be fine.

Geoff.

Hi All,

If you like to know more about D'MIXER that removed the mixer from the most critical stages in a receiver see what Martein Bakker, PA3AKE, has just published; a magnificent document regarding his evaluation of Colin Horrabin's "H" mode mixer under various test conditions and using many different transformers and active devices. He spent thousands of Euros on proper test equipment, and as many hours obtaining his published results. This is the real way we should do measurement but certainly it requires a lot of investment in $$$$ and working time and also knowledge. Martein's document has a lot of pages with a lot of information and it is a good reading for peoples that know what he is talking about and also for people that want to learn. This is a sharing of information and knowledge that sometimes is missing in our amateur radio environment. As Harold Johnson, W4ZCB, stated: I commend the read to your attention, LOTS of meat in the pages. You can get the document at:

    http://www.xs4all.nl/~martein/pa3ake/mixers-overview5.pdf

I am sure you will see that Harold is right, there is a lot of meat to chew and digest too. The comparison is not only associated to the FST3125 switches but there is a very interesting comparison with modern video switches.

A good friend of mine, Eraldo Sbarbati, I4SBX, has done a similar work during 2005 winter. A lot of work. He has made tests on commercial mixers and then on the H-Mode with the 3 transformers (G3SBI original configuration, used in the CDG2000) and the 2 transformers (I7SWX simplified version, used in the STAR) using various balun cores (size, material and turns configurations) using homebrewed transformers. He has also checked where the mixers loose the 1:3 ratio. I4SBX has started the publication of these reports in the Italian Ham Magazine RKE, Radio Kit Elettronica, since this past summer. The final two articles fully dedicated to the H-Mode Mixer, with particular focus on the two transformers version, are expected to be published in the March and April 2007.
Eraldo's tests include the divide by two (74AC74), and fundamental squarers (using 74AC86 XOR and LVDS receivers). The comparison is also referred to the super CDG2000 RTX, front end and post-mixer roofing filter.

It will not be possible to make the translation from Italian into English of all six issues due to copyright and the work required. I will discuss with I4SBX any possibility of publishing a digest of his work, including his tables and graphics produced using the N2PK VNA.

You will be kept posted ... if ...

G3SBI H-Mode Mixer invention has still a lot to give ... Thanks so
much Colin!

73 and enjoy PA3AKE's document.

Gian
I7SWX

I'm designing a box that will use four SA605 receiver/mixer chips that all need the same crystal reference. Even with all the good application notes for the SA605, I'm not sure how to do this. Do I build a Colpitts oscillator from transistors, buffer it, and then use this output as an "external LO" for the mixers? Or do I connect up the crystal to the SA605 oscillator pins as usual and then tap off of this for the other chips? Using a function generator as an external LO, I get the best results injecting a 300mVpp sine wave, if that is useful.

Thank you!

Even if its cheap, it aint *easy*. a 180 mhz Yagi on a 30 foot pole
compared to the soup can users would take to in shorter range high
density regions where they need more channels.

But in any case, whether you all know the technical issues or not, I'm
not going to get that feedback here, so I'll quit bothering you.
My address is 1984 Kirkendoll rd, Clinton AR, 72031. you have my email
addy. send it to the FCC for all I care. That's how much I think they
will give fuck what goes on out here. Besides, there is a whole world
out there of remote areas that are not served well beyond the reach,
whatever that is, of the FCC or their ass kissing agenda to big media.
It this takes off, by the time the FCC figures it out, it'll be like
trying to get CB users to register. <snurk>

Hi Ed, good information.... I have replaced the 2nd mixer in an FT1000MP with an I7SWX 2 transformer configuration, plus reviewing the 2nd IF gain and .... the user (contester and DX man) is so happy he does not want to send it to a friend for review... hi!!!

Hi Allison,

you are right. The H-Mode is not only a mixer for receiver, it is also for transmitter. The H-Mode Mixer is bi-directional so you need only one in an RTX.

BTW, when you here my good friend Art, K1GBX, say hello to him and his xyl ... tell him you did work me on 50 MHz ...he will get crazy...at me ... hi

73

The photo wasn't very well detailed, but from what I can see it looks to be an Amphenol type 27.

Amongst other things it depends on the freq of the LO, the physical distance between the SA605s.

What freq is the LO ?

How far apart are the SA605s ?

-Mark

That doesn't appear to be nearly so much in the "boonies" as I would have thought. As the crow flies you're only something like 5 miles from I-65, right? I'd predict that within a decade you'll be able to come up with some reasonably high-speed, reasonably cheap solution based on the cell service providers rolling out high-speed data services along the interstate there, if you don't already have the option of getting a cable modem or DSL just as soon if you're willing to pay for the cable back to highway 16.

Has anyone attempted repair of said YIG Ocsillator sealed assembly ("A6")?
in the HP 8558B Spectrum Analyser? If so, were you successful?

My copy is putting out -32dbm (spec is +15dbm); otherwise seems fine: sweeps OK, freq is right on, etc.

I suspect the 3 transistor amplifier inside the sealed assy.

Any suggestions?

-georgeK KB1HFT

Huge thanks Glenn, Joel, Paul and Len.

I had to read your mails 'few' times before I fully understood the content. This subject acutally isn't anything you read at coffee break at work within 5 minutes, hi!

I'm gonna stick of course with the IQ instead of using only other component since I've build and IQ transceiver :) I was just pretty amazed that I could have clear FM or AM audio out just by using one component, but immediately notice the 6db change. But now, it's clear to me, there's nothing special in that. The same amplitude can be found in I and Q and OF COURSE we can demodulate AM or FM without the second component.

Actually, Joel, your answers were pretty good for me, even with the "more advanced" math, like Len said, hi. At first glance, I couldn't get anything in to my head, but reading it few times more started to reveal the math behind the whole thing. I'm really looking forward to get more into the math and understanding the IQ demodulation and modulation.

I had very good succestions even for the hardware stuff, but I think I'll stick with the IQ rx/tx I just made. Actually, those HW ideas also gave new aspects of thinking the way how IQ signals can be demodulated in software. I also liked the C-QUAM information. Really nice, because I didn't knew about the whole C-QUAM -thing.

Wildest dream would be of course, FULLY understand the demodulation of any common modes and write my own software, but I've just done some non-FFT releated stuff with Visual Basic, so not so promising :)

I want to thank everyone for the comments and advices, I had more than I've read so far from the articles laying around the internet. Always when ppl are talking to ppl, they communicate, but reading from the books, that's just trying to figure out what a heck has been in the mind of the writer. Ok, depends on the article, some might write in a more common sense.

Just on question more: If I really want to dig into the math thing of IQ modulation/demodulation, is there any articles you would like to succest? I mean, I've never been that good in high tech math, so at least the beginning of the article would have to be understood with 'basic' math.

73 de Janne, OH1GTF

PS. Yesterday my friend OH1CO brought RFspace's SDR-IQ transceiver to the club (club evening) which he just bought. At our city club, we have only 80m dipole hanging on the trees, but that didn't bother us, we could copy wery interesting station on all bands at HF, all over the world. I'm a 'bit' excited! I also received PSK station all over the world @ 80 meters, with just few meters of wire in my shack (powersdr and digipan).

> How many of you have built or building a Paraset WWII Spy radio?

I must admit I'd love one to own, maybe a kit version could be made up? same size and similar controls but made on a PCB to make assembly easier? I have only seen one tranciever ket recently, valve based and that was using a single all glass valve and had space inside for 10? PP3 9v batteries.

I think a 'modern' Parset 'kit' with a mixture of new and old components would sell quite well. I am sure it could be designed to run on 12V and use some clever circuitry to produce the required high tension voltages. Maybe a double sideband version for the no-code'rs too.

regards

I think one of the biggest problems you might encounter is intermodulation between mixers.

If a strong signal is present on any of the mixers, it will intermodulate with the oscillator due to imperfect balance in the mixer. If these intermodulation components get into the other mixer LO ports, it might cause spurious responses.

Try to build some port-to-port isolation into the LO splitter, either resistively (if you have power to spare), with a magnetic or LC 'hybrid' of some sort, or vith individual buffer amps for each stage. If you choose the latter, common base amps would be a good choice as they have very high reverse isolation. Avoid ampliifiers with feedback, as feedback usually ruins reverse isolation.

The board layout is now 90% complete. This project is certainly ahead of schedule at this point. If things keep going this well... the product release could be before the target Sept07 date.

Follow the development of the VoiceMax Speech Processor at:
http://www.telstar-electronics.com/default_files/NewProductDevelopment.htm

My Ranger driven 813 modulator is working very well but now I want to move on to a self-contained mod.

I have ordered a 15 W solid state amp but need some help picking a transformer for between it's 4 ohm output and the 813's running as triodes.

I am sure this has been done many times so perhaps someone can save me the pain of trying to determine the impedance needed for the output of the trans.

Thanks,

JACK K9ACT

Thanks, Joe. Mark, The frequency of the LO is 13.105MHz. The mixers are all closer together, on the same board.

Here is another response I got, for general information:

"That's what I'd recommend... a Colpitts or perhaps a Vacker, followed by a robust buffering scheme, with some isolation (resistive 3 dB pads, and/or separate second-stage buffers) to drive the individual mixer chips. Less chance of interaction between the SA605s that way, and (from what I've heard) you'll probably get a cleaner LO signal that way.

Design and built the oscillator for best performance. That usually means not driving the crystal too hard (don't heat it up or overstress it), and not loading the oscillator itself too heavily (doing so will lower the Q and reduce the stability). The designs I've seen with the cleanest behavior have a fairly gentle drive, and then use a JFET or MOSFET as a first-stage buffer so that the tank circuit has negligible loading on it. Then, add a second-stage buffer (2N2222 or 2N3904 or something like that) and at least one stage of low-pass filtering, so that you get a nice clean sine-wave out. (or, if you're driving a switch-mode mixer, drive a squaring circuit of some sort). Then, figure out how much voltage and drive capability your signal has, and set up resistive-divider networks which will attenuate it down to the desired level to drive your mixers, and let the mixer "look back" into a 50-ohm source at all frequencies - this helps reduce spurs. [This is pretty important in diode-ring mixers - I'm not sure how critical it is with Gilbert-cell mixers such as the SA602] Of course, you could always use another SA602 just as an oscillator, and then tap off / buffer / divide its output to feed the other SA602s. That would still give you good isolation between the SA602s and might be simpler (but perhaps more expensive)."

Janne,

I'm about to order an SDR-IQ board. I thought it was just a receiver.
If it's a transceiver, that's a big bonus.

Realy bad marketing strategy.
Very poor product survey.

I hope that you are not contemplating filling any patents on this product? With this announcement anything filed after March 9th are no longer valid. I also hope that any copyrights and products names have properly been filed. Ot herwise you are out.

james

These are sealed, and even if you could open them,
you don't have the tools or parts to repair. Check
the power supplies and contacts on the bias board,
but this is a common failure mode (blown power amp).

Steve

Richard:

Thanks for your detailed post. I am aware of the "zoom"
approach, but have not implemented it yet. The cosine
multiplication down to baseband is the easy part; the part
that has put me off is the pesky decimating filter.

For others reading this, the basic idea of the zoom FFT is that
if you want to "zoom in on" some frequency region at
higher resolution, you multiply the incoming signal by the
center of the desired range. From that old high school
trig formula for the product of sinusoids, you get a bunch of
sum and difference components. So the center of the
target band ends up at 0 Hz since you multiplied it by a
sinusoid at the center frequency, and all the rest of
the original spectrum is now spreading out on either
side of 0. Now, if you low-pass filter this mess you can
re-sample it at a much lower frequency. The filter has
to be set so there is nothing of significance above half
of the new sample rate, just as for the orignal ADC (or
you get aliasing errors).

Then you take an FFT of the same size (1024 or whatever) samples, but at the new lower sample rate. If the new rate is 1/100 of the original, the resolution of the spectrum is improved x100. Another way to think about this is that if you only wanted to zoom in on the low end of the spectrum, you wouldn't need to do the cosine multiply, filter, or resampling... you could just reduce the base sample rate to 1/100 (if your sound card permitted, and had its anti-alias filters set for that) and get exactly the same results.

Note that this gives exactly the same resolution as an FFT that is x100 larger, where you only get to see 1/100 of the whole spectrum. Also note that an x100 increase in resolution takes x100 increase in sample time, so you must insure that the signal is stable over that interval or you will get spectral peak smearing... there is no free lunch here! This is no problem for Richard's examples of bearings and gear meshes, but I'd expect troubles with most music since it is so dynamic.

Anyway, back to my original lament: The low-pass filtering and resampling would be quite inefficient if done by conventional approaches, but there are apparently some elegant solutions that do both functions in one block, reusing it over and over to get successive halvings of the sample rate. My problem is that I have only seen this described in theoretical terms with simple block diagrams, leaving the exact coefficients, etc, as "an excercise for the reader". Searching the Web I find that others are apparently as left out in the cold by this as I am, and there is no example code, hints, or tips to be found.

So, until this particular reader either gets struck by a flash of insight or takes the time to read up on this enough to get a whole lot smarter, the zoom FFT is on a back burner.

(Richard, I'll Email you about those window routines...
many thanks for the offer!)

Best regards,

Bob Masta

Okay, wait a second.

You're talking about a configuration where the choke is seeing both AC and DC on it, and both are required for regulation. The impressed AC is modulated by the DC, correct? As the DC voltage changes, the inductance changes, so the reactive part of the impedance changes and the AC voltage changes. Do I have that right?

I was thinking about a configuration where the choke sees entirely AC, which would be a different thing altogether, like you see in arc lamp power supplies. I thought they worked the same way but it's clear they don't.

Andy writes:

I've been using Lewallen's EZNEC for about 10 years on my laptop whose operating system is Windows 98SE with no problems..

I just got a new computer with Windows XP Home Edition. EZNEC installs fine, and several of the features work, but when I try to do a Frequency Sweep , the program tells me I need about 2G of memory and that I only have about 1G available.....

My new system has 512 of ram, so I know the problem must be in how it is partitioned (extended vs conventional)...

So, can anyone tell me how this can be fixed without taking the chance of buggering up the XP system that will mess up any other programs ?

Thanks for your advice.

Andy W4OAH

There is no extended memory in Windows XP. It's a flat
address space. Try running your application in Windows 98

compatability mode. Right click on the .exe file and left
click on properties. Select the compatability tab and
enable compatability mode. Select windows 98 from
the pull down.
Then go to "Help and Support" and do a search on pif
Select the "Create or change a pif" result and read up on
how to assign extended or expanded memory to your
program.

Hi Bob,

What you want to resource here are the printed materials available (then) from the manufacturers of analyzers in the time span of 1980 to 1986 or so. Those would include Analog Devices or Hewlett Packard, both of which had superb application notes that went to considerable detail. The academic treatments of that era were mostly semester based fluff introducing concepts, and not many at that. Industry was the best source for actually grasping the concepts and implementing the details. Soon after this period saw the introduction of DSP which is a silicon processor equivalent of the IIR or FIR math (resource Texas Instruments from that slightly later era for this discussion).

You did quite well in describing the "zoom" process. This hallmark of the Real Time Audio Analyzers designed by HP 20 years ago was a long time in coming. They had a 16 member design team working with a million lines of Pascal code. It took them 5 years to develop the product in contrast to the HP design cycle of 18 months. They also had to design their own Pascal compiler.

I would recommend for reading those works from the Program Manager Nick Pendergrass (Google: "nick pendergrass" fft).

I just got a Dish Network "500" dish with two LNBs, mounting hardware,
and the in-home receiver.

Anyone got anything on converting these to UHF-and-above amateur
operations? Pointers on groups and/or lists? All information and
pointers gratefully accepted.

http://www.geocities.com/PatBillDavis/10GhzGear.html

Most of us convert them to 10GHz. They are too small to be very useful at UHF. Plus, the DSS Feedhorn is easily modifed to 10 GHz by boring it out to 0.75 inch and add an SMA connector as a probe to excite the waveguide. See above webpage for a short tutorial.

Groups that do 10 GHz construction and contesting:

The code hating losers were too stupid and lazy to learn and use CW, they're also probably going to be too stupid and lazy to solve TVI and interference problems with their neigbhors. There will be more amateur to amateur and amateur to non-amateur conflicts. Hams will look bad and the FCC will regulate the service more because of all the retards we let have HF privledges.   CQ Breaker, CQ Breaker.

Welcome to CB everybody.

Andy writes:
Thanks John. You got me on the right track. Here is what I did:

1) clicked on the EZNEC shortcut icon and then on Properties and Compatibility.
2) Set Compatibility to Windows 98
3) Used Windows Explorer to locate EZMAIN and right clicked , then on Memory
4) Set Extended Memory to Auto and checked HMS box (I got this from the EZNEC manual
when setting it up for Windows NT)
5) Then I closed stuff out and ran EZNEC with no problems so far.....

I couldn't find any PIF file corresponding to EZNEC, but apparently the other stuff was good
enough...

Thanks again for getting me started,

Andy   W4OAH

A better way to use the 813 in triode mode is to connect the two grids
together. This creates a HI-MU zero bias triode. There is some data
for this in old handbooks for grounded grid operation. However running
them in grid driven mode as zero bias triodes would be identical, except
for lower driving power.

First, Good SHow on trying to interest the kids.

Secondly, have you investigated 160-190 KHz as an option. The transmit antenna would be limited in length to a max of 50 feet but the receive antenna can be tuned dipoles. The transmitter is limited to 1 watt output so it will be a heck of a lot easier to measure then the Low power Part 15 devices. If they live in a rural area they should have little manmade noise to contend with. Tuning the receiver and transmitter can be done with an oscope and low frequency generator. The other thing is the receiver can use a block converter with an AM radio.

Thanks for the reply. I had a "brain fart" at the time I was writing and the term "laminations" escaped me. I have various old transformers of various voltages, I hate to take any apart. I think that I will ohm them out and see if there are any open windings. Yes, hollow state technology, that's what I am in to. Got started at a young age. My grandfather made and repaired radios before and after the war. He is not doing too well now. I have most of his gear and NOS parts and such. Next weekend I'll be picking up his Riders. Got his Drake TR-3 (AC-3 and DC-3 too). I'll be getting that old Drake back on the air! Anyway I'm planning some amp projects in the future (After I clear a backlog of a dozen Transoceanics) I have a few chokes but I just wanted to try my hand at making my own power chokes. Made RF inductors in the past for SW receiver 1930's style. I may be needin' up to 20 hy. I'll be on Google later on researching

I suppose. Just thought I'd mention about the choke cores in case someone knew of a small qty source or had some to sell. I'm thinking about taking a bundle of soft iron wires (bailing wire) insulating them individually and corporately, then winding wire on. Fold the ends of the "core" together. Perhaps a nice project with my son; help him to learn. I've got a 15lb spool of 30awg to experiment with.

By the way, if Prof. Anderson is looking at this, I refrained in reading your latest long ego post. Except for the first paragraph. I will not react nor acknowledge your presence in the future. It would not be edifying. I do not believe you suit my purpose here on these groups, which is the friendly exchange of ideas and thoughts (when I have the free time to get on the computer) No name calling, no self promotion, no condescending attitudes. No bull. It's too distressing.

The good news is that converting them for 10 GHz is pretty easy! Now I
suppose you'll want to get some 10 GHz equipment. I can help you there
as well... http://www.downeastmicrowave.com/

Happy homebrewing!

That is the way I am using them. Got it all together last night and had a short QSO with a good audio report. It takes very little Ranger audio to get 100% mod.

Unfortunately, the plate tuning cap started arcing so I had to shut it down and have a look today.

My experiments at audio have shown that this mode causes more nonlinearity than simple pentode mode. But... maybe not anymore than you'd get from a similar-sized high-mu zero bias triode, as those are fairly nonlinear too!

My experiments were with much smaller tubes (807's and 6L6's and the like) than the 813's we're talking about here. Most of the extant SPICE models do pretty bad when you tie the screen and control grid together (not surprising!)

Tim.

> Please post a schematic on your web site!

Tim -

You might be surprised how few parts there are in a classical zero-bias class-B modulator.

There's a schematic in the 50's/60's ARRL handbooks, and the ENTIRE circuit is two 811A's and an output transformer. That's it!

This simplicity is the cunning advantage and popularity of zero-bias triodes (or zero-bias-triode operation of the other tubes). Once you get to beam tubes/pentodes with all their bias supplies and screen supplies and power-supply-sequencing etc. you start getting into having to draw schematics.

Later editions added a pi filter on the output to reduce "splatter" and a control relay to remove plate voltage on receive.

Tim.

I guess I'm more interested in knowing what the supply and grid voltages
are, transformer ratios, a bill of materials, that sort of thing.

Yes, you are correct that the schematic of a one cubic foot, 100 pound monster amplifier could be drawn on a business card, but still...

I too am interested in the transformers that he's using. Tubes are
easy to come by in comparison to appropriate modulation transformers.

And it can't be the super-simplest implementation because I see some
pictures with little power transformers with diodes and electrolytics
forming some kind of bias supply.

Then you have to work hard to not burn up your favorite modulation and
plate transformers :-). Plate chokes, I can rewind them when they
catch on fire now!

Tim.

I agree that on not taking apart a good transformer!

There are enough bad ones that it shouldn't be necessary,
anyway.

The main problem I see with that is the magnetic properties
might not be as good, resulting in fewer henries than desired.

> =A0I've got a 15lb spool of 30awg to experiment with.

EXCELLENT!

You might consider making some sort of winder. Chokes
typically involve thousands of turns, and you don't want to
just jumblewind them.

I will see what sort of basic choke data I can find in
my library.

Google my call, too.....

I am planning on building a solidstate amp of about 100watts to use with a low power transceiver. My interestrare 20 thru 10 meters and I thought I could save a little board space and maybe money if I designed the output transformer to cover just these bands. I have half the cores I need to build a transformer that covers 80 thru 10 I was wondering if this would be good enough for a transformer for 20 thru 10. Also the amp will be mounted right at the base of the antenna I am thinking of designing the amp with an output impedance considerably less than the usual 50 ohms. I am thinking this would make fial matching to the antenna easier. Any comments would be greatly appreciated.

Hi Jimmie,

As for the transformers needed for your project, thinking about it quickly, the inductive reactance would decrease as you leave out cores so at the higher end of the band I think you are going to have problems.
  I�m sure there are others in the group that can guide you in this area.

Whatever you end up doing put an output filter on the thing as it will amplify whatever you feed it just like the fundamental. Yea, I know, all modern transceivers are clean. A little �over-kill� never hurts.

I'm very curious why you are interested in mounting the amp at the antenna? Do you intend to use it as a matching device for the antenna as well as amplification? I believe that is where you are coming from with the idea.

I want you to think about a couple things. The solid-state amp is going to be a DC powered device. How long will the power lines have to be to reach the amp at the antenna? You would need to run two wires, of course, that are going to have considerable DC losses especially with the current the amplifier has to draw. The �I� squared �R� power losses would be substantial even on a short run.

The second thought is about the actual coaxial loss that could take place at 28 to 30 MHz. As long as you are not planning to use RG-58 or cheap RG-8, or making a few hundred foot run, the line loss would be negligible compared to what you might gain from the amp being at the antenna. Also, it sure is much easier to work on it in the shack instead of having to climb a tower to yank it down.

As a final thought, if the antenna is 25 ohms, do what you need to do to make it OK. The worst case at a 2:1 SWR is around 10% power loss. I am a bit of a perfectionist with the impedance thing. So, I recommend choosing whatever matching system hits your fancy. If it is a balanced antenna by all means use a BALUN!

If we were talking about 2 meters or higher I might be a bit more concerned.

I do hope this helps with your ideas and project. I would be interested in knowing what you decide.

73,
Paul

Not exactly! You're mixing input and output powers.

Current FCC rules limit us to 1500 watts peak output.
On AM, that typically works out to 375 watts carrier output.

To make the math simple, let's assume our Class C
plate modulated final stage has 75% efficiency.
Then we will need to run 500 W DC plate input to get
375 watts carrier output, and 1500 watts peak output.

The audio power needed to plate-modulate that 500 watt
DC input stage is 250 watts - exactly half the DC input.
More modulator power is OK - it's a good idea to
figure on 300 watts or so, to allow for various losses,
and so the modulator tubes aren't running flat out to
give you 100% modulation.

You can easily see how the design could get complicated
in a hurry. Suppose your Class C modulated stage is
only 50% efficient, instead of 75%. Then you would need
750 watts DC input to the stage to get 375 watts carrier
output. And you'd need at least 375 watts of audio!

--

When reading old Handbooks and other amateur
radio publications, it's important to remember that in
the past hams rated transmitters by DC input, not output.
If you build a "100 watt" transmitter from those days and
expect to get 100 watts of RF from it, you will either be sadly
disappointed, or will run it way over design ratings
in order to get those 100 watts.

In the bad old days before 1984, Part 97 simply limited
US hams to 1000 watts DC plate input to the final. Which
meant you simply needed 500 or so watts of audio to plate
modulate a legal-limit AM rig, regardless of efficiency.'

The old rules are one big reason plate modulation was the AM method of choice for the Ancient Ones. The carrier efficiency of most other AM techniques (grid modulation, screen modulation, suppressor modulation, cathode modulation, conventional AM linear, etc.) is only 30-35%. So for a kilowatt DC input, you could only get about 300 watts of carrier output, and you'd need a final that could dissipate 700 W!

Under today's rules, the DC plate input doesn't matter - only the peak RF output matters.

btw, there's all sorts of tube data info online. No need to buy tube manuals anymore unless you are really into paper!

Nah. The number of question marks is immaterial and avoids the contentious and intolerant (rant?) of the OP. Such comments very divisive to the the Amateur Radio hobby; IMHO.

Might one not think such an intolerant (possibly also an elitist?) attitude by a serving (already licensed) radio amateur does not augur well for the future of the hobby. Not sure as a newcomer I'd want to join a group with members who have that 'unkind' attitude!

Previously noticing some other intolerant (even vituperative) comments would not be surprised they may tend to give outsiders a view of an outdated, closed knit clan/society. Old codgers still using spark transmitters and coherer receivers, pounding away in their dimly lit shacks late at night and boasting about how many countries they have contacted for 500 milliseconds per contact; and please QSL.

QSLs via the Internet these days I presume?

Total four (4) question marks; used one at a time!

Rather than portray Amateur Radio as open, welcoming to younger newcomers and new modes of communication/trends.

No wonder the hobby is, in the opinion of some, dying?

The hobby is alive and well, though offshooting into private little cliques here and there.
Paul W. Schleck is a bit delusional what with his new, exclusionary new newsgroup, but like all fads, this one, too, will pass.

Paul's new moderated group, I predict, will see a modicum of new users at the outset, but after, say, 60 days his moderated group will wither on the vine and become history. His new moderated group was doomed for failure well before it reached fruition.

I wonder if BlowGut Paul will send his "welcome" messages to the new users of his self-serving moderated group? He, Paul, has a knack for being an insufferable blowhard. Come to think of it, he is not too far removed from the gasseous emissions of Lennie, the California Cryaby who still has issues with old zoning matters.

Oops! Tsk! Tsk!. Did I poke politically incorrect fun at a poor, disgruntled oldster whose colostomy bag runneth over?

> well as amplification? I believe that is where you are coming from with the idea.
>
> I want you to think about a couple things. The solid-state amp is going to be a DC powered device. How long will the power lines have to be to reach the amp at the antenna? You would need to run two wires, of course, that are going to have considerable DC losses especially with the current the amplifier has to draw. The �I� squared �R� power losses would be substantial even on a short run.
>
> The second thought is about the actual coaxial loss that could take place at 28 to 30 MHz. As long as you are not planning to use RG-58 or cheap RG-8, or making a few hundred foot run, the line loss would be negligible compared to what you might gain from the amp being at the antenna. Also, it sure is much easier to work on it in the shack instead of having to climb a tower to yank it down.
>
> As a final thought, if the antenna is 25 ohms, do what you need to do to make it OK. The worst case at a 2:1 SWR is around 10% power loss. I am a bit of a perfectionist with the impedance thing. So, I recommend choosing whatever matching system hits your fancy. If it is a balanced antenna by all means use a BALUN!
>
> If we were talking about 2 meters or higher I might be a bit more concerned.
>
> I do hope this helps with your ideas and project. I would be interested in knowing what you decide.
>
> 73,
> Paul
>

I was tired when I made the post and for got to say that this would be a mbile unit. antenna mounted on my tool box in the bed of my pickup. It was really just a thought about mounting the amp in the tool box since room in my little Nissan is scarce. From there I made the leap to thinking since the feed point impdance of the antenna is already going to fairly low and feed line length practically 0 why step it up to 50 ohms just to drop it back down again. More realistically I am thinking a short antena on 20M may be more like 10 ohms wich would be a 5:1 SWR and I dont think my amp would like that much. At best I am thinking the 10M antena I am planning on using will have the 25 ohm impedance you metioned, 15 and 20 m antennas would have even a lower impedance.so an output impedance of say 15 ohms might be a good thing.

Jimmie

All OK Jimmie, now I get it. Mobile never entered my little mind.

If you were only going to use one band I can see how the idea might work. But, looking at all the different impedances the output will see on the different bands will be a problem.

I just tore apart an old plasma amplifier that utilized a solid-state driver stage. It�s loosely based on the Motorola design. Anyway, the output transformer uses three beads on each side. You are welcome to it if it will help you out with your project. Its just collecting dust here and I have no further use for it.

73,
Paul

100Khz band width seems like a lot of overkill to me to be feeding a sound card. Several years ago I built something like is beig asked about using and instumentation grade op amp with a bipolar emiter follower circuit . Negative feedback to the opamp was taken at the output of the amp. Specs on this thing was unbelievable. DC to 500khz(limit of the test equipment) with about 1.5 mv of noise. How I dream of the days of having a bench stock like that to select parts from again. Made a great headphone amp.

BTW, initally used a 741 in the circuit and it had about 5mv of noise. If this OK it could still do the job for you.

Can you imagine that? People could communicate around the world simply by constructing a simple transmitter salvaged from a Model T ignition coil and a receiver contructed of metal filings in a glass tube between antenna and ground and a battery powered relay.

Amazing. Absolutely amazing.

Yes, with the most basic materials; little more than a battery and
some wire, in an emergency or primitive conditions you can communicate
via wireless. But you must have one more thing; gotta have code

Right. And that's still modest for a pair of 813s, at least used as
pentodes in class AB-2.

I think at that point I'd decide I needed a better modulated stage,
unless I were operating at UHF.

The tube manual I quoted is good for two things that you don't get as
easily from the web -- the front pages are a very good text on tube
amplifier design, and you can read it while you're eating your cereal in
the morning. I'm just old enough that I need things on paper -- were I
ten years younger I'd probably not need it at all.

The problem with 807/6L6's in zero bias is that the suppressor cage is grounded to the cathode and messes things up. With the 813 you can connect the suppressor to the plate and the two grids together (or connect the suppressor to the grids). One way or the other will work better than grounding the suppressor.

There have been triode circuits using the 807/6L6/1625 or even sweep tubes (such as the 6AV5) in which G1 was tied to G2 with a resistor so G2 was driven harder than G1. One circuit used a dual cathode follower driver with a center tapped choke to provide a low resistance ground for the grids (actually used one winding of an interstage transformer).

A member of a radio club I was in years ago built a high power two meter

AM rig using a 5894 final modulated by a pair of 6AV5GA's in such a
circuit. It always got glowing reports on audio quality.

BTW I have 5 or 6 used 813's in the junk box gathering dust. I'd like
to keep one for static display and the rest are available for nominal
cost and shipping. If anybody can use them let me know. I'll also take
2 or 3 good 811A's in trade.

Have an 8558B (Serial # prefix=2332A) that seems to work fine except that it indicates ~ 30 dbm low. Any suggestions as t what might be the cause?

I suspect the U1 diode pair in the 1st LO. 1) How to test same? 2) appropriate replacement diodes if indeed they are bad?

Please advise

-georgeK KB1HFT

> pentodes in class AB-2.

Agreed - in fact, maybe even in AB1!

A pair of 813s in full-yellow pushpull Class B audio service
can deliver 650 watts of audio, according to my 1948
ARRL Handbook. With just 0.35 watts of driving power.

I think the main reason the Ancient Ones used triodes
in their modulators so much was to avoid the problems
of a screen supply and a bias supply. Since they were
building a separate speech amplifier anyway, building
one that delivered 10 watts or so wasn't much different than
building one that delivered a watt or so.

Two articles of interest:

In QST for November, 1958, is "Medium to High Power Audio from 813s".
A modulator using 813s in pushpull AB is described. It is really quite
simple, too.

The bias supply is just a halfwave rectifier feeding a 0B3/VR90.
Screen supply is obtained from the plate supply with good regulation
and without a humongous power resistor by using a 211 triode as a
series regulator, and a string of NE-2s for reference.

This series regulator setup has a lot of advantages. The screen supply
is regulated, there's no enormous dropping
resistor, and most component failures result in a loss of screen
voltage rather than excessive screen voltage or screen voltage without
plate voltage. But you need a big
triode for the pass tube, with a well-insulated transformer to
light it.

According to the article, a pair of 813s in AB1 will provide 260 watts
at 1500 volts B+, or 335 watts at 2000 volts B+ - with *no* driving

power!

In AB2, it says you can get 455 watts at 2000 volts and 650 watts at 2500 volts, with less than a watt of audio drive.

There is also a "peak extension circuit", which is a form of supermodulation by limiting the negative modulation percentage. Such a system was a big deal in 1958, but if
you use one today, the carrier power has to be *decreased* to stay legal! Hardly seems worth the trouble.

Another interesting article is from QST for March, 1948. "500 Watts of Audio from AB1" shows a modulator
that ends up with a pair of 4-250As - driven by a pair of 6SJ7s in a phase inverter! Speech amplifier, mod iron, screen regulator VR string, bias and low voltage supplies are all on the one 17x13x3 chassis...all you need is 2500 volts for the 4-250As.

The only transformer in the audio chain is the modulation transformer - all other stages are resistance-coupled. The speech amp is just four tubes - 6SJ7 mike amp, 6J5 2nd audio, pair of 6SJ7s phase inverter.

I chose 50% to make the math simple and to illustrate the point. And it's easy to get less than 75% efficiency in real life when a rig has certain compromises, like trying to cover 160 through 10 with tubes that have lots of output C.

I have just completed the design of a 151 MHz ASK transceiver.

On the bench the unit works fine with sensitivity to around -115 dBm
however, when I attach an antenna, the RSSI level increases dramatically
and it appears something may have become unstable.

I have tried a commercial ground independent antenna and a 1/4 wave whip and the results are the same.

If I disconnect the antenna and leave the RF input floating, it behaves properly. I can also attach a small wire (say 300mm) directly to the RF input and it also works fine. It just plays up when I have a proper antenna connected.

I am not sure if this may be some issue with the VSWR of the antenna causing some instability (I tried a 3dB pad between RF input and antenna and this did not fix the problem), or whether the input is so sensitive that it is picking up the LO from the radio and causing regeneration ?

A Spectrum Analyser was used to determine if anything else is being transmitted in that region and it appears to be clear to well outside the bandwidth of my receiver.

Any ideas much appreciated for what might be happening or methods of debugging my design.
(The circuit consists of an RF switch after the Antenna port (selects TX/RX) then into a 50 Ohm RF Amp, followed by a tuned circuit into an SA6505 RF IF. The LO is crystal based harmonic Butler emitter follower.

PS. I also tried bypassing the RF Amp but still no improvement.

Thanks in advance

Regards

David

If you suspect stability issues, you might try connecting a variable
resistor and variable capacitor to the input and try to check various
settings to see, if you can repeat the situation without the antenna.

>A Spectrum Analyser was used to determine if anything else is being
>transmitted in that region and it appears to be clear to well outside

Depending on your location, the band noise level at 150 MHz may be
well above the thermal noise from a simple resistor. How well is the
spectrum analyzer calibrated ? Did you get the reading for a 50 ohm
terminator resistor at the input and then compare the band noise with
the 1/4 wavelength antenna ?

"50 ohm RF amp" sounds like some MMIC, such as the MAR-x series. I
hope that you are not using MAR-8, which is not 50/50 ohms in/out :-).

I have a headset electret condenser mic that has a low frequency response.
Other than changing the element is there a means of getting a higher
frequency response?

Optimise the series (DC blocking) capacitor in the amp input.

I`ve been a Ham since 1975 and seen this kind of talk before. You 2 are the ones destroying Ham Radio. Yes ham radio is alive but not well. The numbers are dropping and the age of us Hams are getting older. Soon if we don`t attract younger people in it will be a dying hobby. Code is important yes but not totally necessary. There are other ways of encouraging young people to become hams. Code can be part of it as well as the computer end. Why not be like the Boy Scouts have HAm Radio clubs in schools from grades 1 and up and in churches or the YMCA/YWCA with volunteers.

Rather than bash each others heads and stoop so low as calling each other names why not put your heads together and think of positive ways to bring new people into the fold !

It could be that there are local signals in the band which are overloading the receiver and the receiver lacks selectivity to discriminate between on and off channel signals.Or an IF image response is reacting to a specific interferer. Have you tried tesing inside of a shielded screen room (faraday cage)? Secondly, the gain of the circuit could exceed the shielding and grounding of the circuit layout, thus feeding back from circuit to antenna. In this case, assuming a 50 ohm circuitry, extend the antenna with a length of low loss coaxial cable away from the circuitry, put the circuit in a shielded box with appropriate feedthroughs, and check for interaction.

I think the terminating impedance has an effect on the response. A serach on either condensor mic or electret should yield some info. I know that the housing or cavity that the element resides in can have a pretty dramatic effect as well.

Hi folks,

Can anyone help me with a data book or catalog listing data for the Toshiba limiters, circulators, MMIC front ends, etc. for JRC/Raytheon/Furuno X-Band boat radars made in the 1980's.

I have searched the net and found nothing, and yet I own dozens of these devices pulled from junked radar units. I have a 'rough' idea but it would help to know the original specs, mainly for the MMIC devices.

I realize they won't tune the hamband, I really just want to find out if they meet original specs.

Thanks!!!

I am looking for the complete set of codes that are sent to a Racal RA6790/GM receiver via its stock GPIB (IEEE-488, HPIB) port. $02F12.12345 changes the frequency of number 2 receiver (set with dip switch next to the GPIB socket on the receiver) to 12.12345 MHz.

The manual found on the Internet discusses the use of a serial port.

Google pointed to a site where a 232 to 488 converter was used to control an earlier model of receiver that contains a GPIB module. Some of those codes do work with the RA6790/GM.

Pointers to the information will be appreciated.

Need to wind a toroid with a center-tap. Have seen this somewhere, but can't remember where and can't find it. Anyone know how to easily wind a tap into a toroid? Am thinking maybe put a loop at that point with a twist in the wire to keep it from slipping back onto the toroid and loosening the other windings. Anybody have any ideas on this?

TIA

Dave

You aren't going to directly damage any cars around you even with high power, but you might affect some with a 100 on HF or even 2-meters.

>overload to a nearby radio likely? At what power level is damage

Ham or broadcast? Broadcast is generally fairly sensitive to overload. On-the-road it's likely to be for a very short duration so I'd not worry about it.

>likely, and to what componets?

With today's cars it's unlikely you are going to damage any components unless you have a grounding problem and then the computer is the most susceptible.

>
>I am currently using only 50 watts on a 5/8 wave (2m), 25w on a 1/4
>wave (10m), legal 4w on a 1/4 wave (11m)

I've run 160 watts on 144 which will *typically* desense another 2-meter rig for up to a 100 feet or so, but it depends on the rig. I've also stopped the car next to another mobile with no *apparent* problem although here certainly had to be some desense. I've also "desensed" a mobile 50 feet away with a 5 watt HT (It did have a clean signal) I also shut down the cable TV system for an entire town with a 5 Watt HT at a demonstration, but that's another story other than to say two days after the demonstration you couldn't find a cable leak in the whole town. <:-))

Some mobiles are running up to 600 watts on HF without problems while others can't get a 100. Most of the car manufacturers are saying you shouldn't go beyond a 100. I'd have no qualms about going to 500 or 600. If it works, fine. If it didn't I guess I'd have to pay for what ever broke.

When I purchased my 4-Runner the Toyota mechanics ran the wiring for my VHF/UHF rigs and that was about 6 years ago. My wife runs a 50 watt (Kenwood TM-V7A) in a Toyota Prius (Hybrid). I'm thinking of leasing one while they still have good prices and a surplus of cars available which will disappear sooner with the price of gas going back

```
up. Only problem with leasing the Prius is how to run an HF rig in
there.  Their 12  volt system is very light duty and that 500 volt
batter might be a bit steep for my mobile rig. <:-))

Some thing wrong there. I'm running two stations here and both are
capable of the legal limit. The one in the shop is a bit more modest
with a 2K4 instead of an Alpha, but both are *old*. OTH there is the
whole Hallicrafters station in the shop as well. The antennas are
fairly close and there has never been a problem. Those antennas
http://www.rogerhalstead.com/ham_files/Tower30.htm (the wire antennas
are difficult to see) are much larger than what your friend would have
had on the mobile. Unless the mobile antenna was almost touching the
other rig's antenna and I do mean almost touching it shouldn't have
created a problem. The antenna over the driveway would have had to be
low and very close to the mobile antenna.

>three times to think it through and as he should have been doing,
>switch his base antenna (dipole over the driveway) to ground, when not
>in use.

I don't ground or disconnect any cables even during thunderstorms.
Basically I can't easily get to the cables and any thunderstorm would
be past by the time I could get them disconnected.

The tower, with a large antenna system
http://www.rogerhalstead.com/ham_files/Tower29.htmtakes an average of
3 visually verified direct hits a year although it took 5 by the
beginning of August last summer. OTOH I have a good single point
ground with 32 or 33 (lost count) 8' ground rods CadWelded (TM) to
over 600 feet of bare #2 wire that ties the whole antenna system and
house electrical ground together.

Those were the days when the techs would check the output by putting
their hands up in front of the antenn to see if they'd get "warm".

=======================
A bi-filar winding  A-a and B-b .  Connect a to B (that's the centre)
Number of turns is half the total required.  A and b are obviously the
end connections.
So a toroid requiring 10 turns with a centre needs 5 bi-filar turns.

Besides a bifilar winding, which has already been suggested, try this:

Start at the middle and work towards the ends.

Say you need 10 turns center tapped. Take a piece of
wire long enough for 10 turns, find the exact halfway point,
scrape off the insulation there and make a twist.  Then put the twist
on the outside of the core, and wind one end 5 turns one way around
the core, and the other end 5 turns the other way.

Or, use two pieces of wire long enough for 5 turns, Wind the first
one, bring its end out, twist/splice to the second one, wind 5 more
turns.

Geez what a bunch of tossers you all are - you don't like someones postings so
you try and get him evicted from the net, why not just use a kill file - you
DONT have to read his posts/threads now do you ?

Why is it the net is getting populated by the biggest bunch of self absorbed
little Hitlers ? You don't like someones posts so you bloody complain or mail
bomb them - grow up you bunch of fucking sad gits !

Richard.

: windering if there was anything you could do?

If he is not actively using tactics to avoid or sabotage killfiles
(posting from various systems, forging, massive crossposting to create
cross-newsgroup flame wars) then it should be quite easy to killfile
him.

It does seem that the frequency and the size of his posts are
approaching net abuse.  However, IMHO, they aren't quite there yet. If
his postmaster were to act in this instance, it would raise troubling
censorship issues.

Who's answer in broken english was "We don't support those products any longer". And I asked in disbelief "Can't you help me with data sheets or tell me where on your website I can download the .PDF files". Mr. Suckagookie said "We no longer have that information". So would you like to kmow how many of those "If you want to talk to a real human you are S.O.L., if you want to listen to more stupid choices press 2" that I fumbled through just to get Mr. Suckagookie on the line.

Have you had any luck getting obsolete data sheets from a Jap company recently? I thought not. Duhhhhhh.

Thanks for casting the first stone of stupidity by accusing me of not having tried all logical avenues first. Thanks for appending Duhhhhh to your reply as an insult to me.

About all I can really say is that you are probably one of those assholes who is to stupid to turn off their foglights when it isn't foggy. Thats why they are called fog lights and not "Turn'em on any f--king time lights". See if they were supposed to always be on they wouldn't have that second switch that intelligent folks use to turn them off with. Yes, giving you access to usenet newsgroups and giving you fog lights was like giving a machine gun to a fucking monkey. Same results. Do you have any idea what those parts I mentioned above are used for and how? Do you know anything about 9.3ghz to 9.5ghz portion of X-Band where I spend most of my work day. Here's 50kw of ionizing radiation for your thoughts. Remember, always look directly into the magnetron at very close range while testing the pulse forming network, it will spark your imagination. Found an old CB amp in my junk box today. Spec plate on the amp says it will
cover 80 thru 10. I plan on doing some mods improving the bias.and add some
filtering I think this may give me what I want. I forgot I bought a 5 galon
bucket of these amps at a hamfest years ago and still have a few around.

Mac, there's about 13 pages in the manual about this (the later versions
anyway pp 3.34 to 3.47). I'm sure Gary will be only too happy to sell
you one of the reproductions he does...

Jack, I really enjoyed reading your writeup and looking at the photos.
You have a wonderful one-of-a-kind transmitter there. It looks great.
Hope to talk to you on the air one day. 73 de Randy, WB5KCM

I want to make one 2 stage low noise fm amplifier. 88~108Mhz. 75 ohm
input output impedance.
I am newbie to this field but i am attracted to learn by bulding.
I hv bought RF transistor & & hv it's .sp2 file. Also downloaded
quicksmith chart, RFsim99 etc.
Can u help me in designing?
The s parameter of the input transistor is

S parameter for 50 ohms

```

Really nice, Jack. Did you use the Ranger audio system to
drive the 813s?

Such a project is never really "finished", because there are
always new ideas and parts to be tried out.

Congratulations, its beautiful! Tube transmitters
should have windows. For some pictures of transmitters
with windows see:

Roger. I started a thread earlier on using 813's as triodes and it was like falling off a log. The modulator consists of a very small chassis with a fil trans, tube sockets and a meter. This sits next to the mod iron on a wood deck. I like the idea of the mod iron isolated from ground.

> Such a project is never really "finished", because there are
> always new ideas and parts to be tried out.

Roger again. I want to eliminate the Ranger for one thing starting with the audio. I bought a 4W audio pre-amp and when I get tired of playing with the new rig I want to see if this will drive the 813's. I need some ideas on interfacing the two... some sort of interstage audio transformer I suppose.

Then, a simple xtal controlled exciter would be fun.

No end is there?

Besides a bifilar winding, which has already been suggested, try this:

Start at the middle and work towards the ends.

Say you need 10 turns center tapped. Take a piece of
wire long enough for 10 turns, find the exact halfway point,
scrape off the insulation there and make a twist. Then put the twist
on the outside of the core, and wind one end 5 turns one way around
the core, and the other end 5 turns the other way.

Or, use two pieces of wire long enough for 5 turns, Wind the first
one, bring its end out, twist/splice to the second one, wind 5 more
turns.

73 de Jim, N2EY

Gotcha. I am new enough at winding toroids that I am probably going t use
the bifilar winding technique, which seems like it might be more forgiving
if I need to make adjustments afterward (correct me if I'm wrong.) But I
understand what you are saying here, and appreciate your input. Thanks
much. Once I get more adept this is what I will do.

Dave

Gotcha! (I think.) So I should wind half my turns with A to a, then
connect a to B and wind the other half. Have I got that right? Or do I
Wind A to a and then wind B to b over that (not actually connecting one to
the other), using B as my CT? (When I first read this that's what I thought
you were talking about, but now am wondering...)

Thanks for help,

Dave

Dave-

How critical is your center tap? If it important that the tap be perfectly centered, it would be better to use one bi-filar winding instead of the two separate windings you describe.

If possible, spread the turns out over the toroid so the end is next to the beginning, so the center tap can be easily connected.

If there are a lot of turns using small wire, you can first wind the wire pair onto a shuttle (a long, skinny flat spool). Then unwind it from the shuttle while passing it through the toroid. With lots of turns, it might help if the two wires were different colors. Otherwise you would need an Ohmmeter to determine which is which.

Hey Fred,

Actually, I realized after I posted that last one that it is not actually a "center" tap. It is tap about 20 to 25 % up from the start, in a 2 uH coil. The original plan called for an 8-turn (on a 1.5 in form) air core coil with the tap on the second turn, but I am wanting to modify that to use two switchable coils with as little interference between them as possible, thus the toroids rather than air-core coils. My calculations tell me that a 2 uH coil (on an Amidon T-50-2 toroidal core) would have 22+ turns, so I am guessing the tap would be around 5 or 6 turns. Question: could I wind the first coil (for 2 uH) and then overlay it with the second (for the five or six turns), connecting them at the beginning and hooking up their respective ends to the appropriate components? If desired, I can upload the schematic

I am wanting to modify. It is the oscillator described in the Hands-on-Radio column of QST in the Aug/Sep/Oct/Nov issues (experiments #43/44/45/46 in the series.) The original idea was a Hartley osc. that ended up becoming a crystal-controlled transmiter for the 40 meter band, but I am wanting to use the osc to build a makeshift signal generator for testing another project. (I don't have a signal generator currently, thus the attempt at building a makeshift one.)

Apologies if this is too confused. I am obviously a newbie. If all of this is so far off-base as to be hopeless, just tell me so and I'll try not to bother again.

Thanks,

Dave

IMHO, the bifilar technique is more difficult and harder to
adjust.

Also, a bifilar winding used as a center-tapped coil will have
higher inter-winding capacitance and a lower self-resonant
frequency.

One thing to remember about toroids is that you can always take
all the wire off and start over.

Perhaps the best idea is to try all the methods and see
which works best for you.

>=A0But I

It's most likely not the mic causing that issue. Most condenser mics have a great freq response. You should look at the circuit and zero in on any RC filtering that may be taking place... giving you that "bassy" sound.

Hello mates!

I'm really confused. I just built an I/Q based transceiver (mostly following the Youngblood articles) and just noticed that when I'm using either PowerSDR or sradio, I can still demodulate everything if I plug I or Q connector off from the rx.

I thought that PowerSDR and Sradio are both IQ based softwares. Is it done just by mixing the audio to baseband. Where those programs need the phase relation between I and Q. Yet, I noticed that putting the other component back, the reception improved many db.

Looking for some answers. Thank you!

73 de Janne, OH1GTF

Quite true on wideband audio response and the necessary amplification that must follow it.

Working around stray RF fields can cause other problems around electret microphones. They are inherently high-impedance so one has to pay attention to the VLF and up stray RF because of that high impedance...especially if using newer op-amps or other active devices having high frequency amplification. It is a compromise in design: attenuate the VLF and above response but hold the microphone amplifier response flat out to at least 10 KHz.

Here's a suggestion that's an old one when I first tried it (successfully) 30 years ago on multi-filar windings: Get an old hand-operated drill (electric if it has slow speed), lay out equal lengths of magnet wire, tape one end of the bundle securely, chuck the other end in the drill and do the twisting. Pause several times while doing so to make sure there aren't any sharp twists along the way, "iron" those out with fingers. You can get an idea of the number of twists per inch (or meter or whatever) as you pause...for wideband RF transformers the number of twists per unit length need only be approximate. What you wind up with (no pun intended) is the equivalent of multi-wire balanced transmission lines of relatively low impedance and the total length would be roughly a quarter-wavelength at the highest frequency of such a transformer.

However, if you are doing a tap for a lower-impedance point such as an oscillator feedback or impedance in/out, the physical tap position doesn't have to be precise or absolute (lots of other factors will be involved there). Just get as close as you can to published data/article on tap position and you'll be okay. Winding toroids may be new to lots of folks but all it takes is more patience than with old-style cylindrical forms.

I might add that, once a circuit is working with a toroid, it can be secured by using some petroleum-based varnish lightly brushed over it. Most "boat" or "spar" varnish types are good for that but one is stuck with having to buy quart cans of it (rather expensive). The reason I mention marine varnish is that it stands up to moisture in the air. If you use "Q Dope" (liquid form polystyrene) it looks very nice when done but a year from now the moisture normally in room air can "lift" it from non-porous surfaces. On testing with MF to UHF Q Meters, there is no more degredation of Q using varnish than with liquid polystyrene or lacquers. I use the McCloskey brand "Gym-Seal" varnish because that is also good for wood surfaces around the house; it was originally formulated as a surface varnish for gymnasium floors and the like. Takes at least an over-night drying time with a complete cure in two days.

I posted a small windows program in alt.binaries.schematics.electronic that some here may find useful.
The subject line to look for is "Paralel resonant circuit tuning range calculator program. -
TuningRangeCalc.zip (0/1)".
As the name implies it calculates and displays the resulting capacitance range and resonant frequency range
for a parallel resonant circuit using a main variable capacitor along with padder and trimmer capacitors. The
values for the parts are set with a set of slider controls and the results are displayed as the sliders are
moved.

I hesitate to put an oar in because I'm one of the brand new Hams. We managed to get two dozen people to a one weekend tech class that were mostly drawn from the membership of Community Emergency Response Teams.
I think that the service can be alive and well if it continues to adapt itself to public need rather than to individual preferences no matter how strong.

Having said that I will now admit that I was somewhat disappointed by the ease with which I passed the exam. I had a novice license back around 1973. At that time you had to pass the general theory to get a technician class license. Obviously that is no longer true.

Now at the risk of being dangerously on topic let me ask the question I came here to ask in a new thread.

One thing I want to add. I have built tayloe detector polyphase network receiver before and I know,

that we need I and Q to cancel out the image. But how the heck AM and
FM is done?

I just have a glue, that the I or Q signal is mixed to a higher
frequency and detected in traditional way,
but in software. Though, is there reason to mix it to a higher
frequencyif we are doing it in software?
Ok, that was the glue about FM, but AM, I can't even have a glue...

Thanks,

Janne, OH1GTF

Hi Janne,

I and Q each contain all received signals, and unless your ears are better than mine you can't really tell whether you're listening to I alone, Q alone or the full demodulated signal. I and Q are needed together to determine whether the signals demodulate into the upper or lower sideband, so if you have signals spread equally across the band, listening to only one of the channels will fold the upper and lower sideband signals together and you will receive twice as many signals in a given bandwidth. This is the same as a simple DC receiver. Note that your spectrum display will be symmetrical about the baseband frequency if you disconnect one channel--all signals appear twice--in the upper and lower sidebands.

In theory, I and Q each contain half the received power, and if only one channel is present you spread the 3 dB reduced power to two places (upper and lower sideband) so you will see a 6 dB total loss with respect to the fully demodulated signal when you disconnect one channel.

AM and FM demodulation can be done in software regardless of whether the signal is mixed to a higher audio frequency (say, 11 KHz as some SDRs do), or mixed right to baseband. For AM at least, the demodulation algorithm is probably a little simpler when mixed to baseband. For FM likely the opposite is true. Once you understand the nature of IQ demodulation a little better the AM and FM demodulation algorithms may become self-apparent to you.

73,
Glenn AC7ZN

Personally, I think the service needs to stop focusing on raw numbers of licensed hams, and instead on the *quality* of those hams licensed. I would rather have 5 hams licensed who are interested in antenna theory, emergency communications, etc., rather than 10 hams who are interested in using ham radio as a cheap cell phone.

The current structure of the theory examinations is a joke. They really do nothing to ensure the applicant has a through knowledge of the topical material. For example, you could have failed each and every question on rules and regulations, and yet still obtained your license, simply because you know math well. This is not, IMO, a good thing. We are, however, unlikely to see this change for the positive, and highly likely to see the theory examinations weakened further as we move to a "simply mail in your 605, no exam needed" ham radio of the future.

Give me quantity. Antenna "theory" has not changed in 50 years, it is a given--a "known" in its present state. We need mind to come up with new ideas, apply newly discovered physics and give us something new to work with.

What do they need to know to grab their rig, coax and antenna off ebay and begin in the amateur bands, oh yeah, and know band limits and modes.

Without clear Line Of Sight do not exist. I intend to solve that problem. If I do, I'll get rich. The equipment now being offered is not deigned by people who live in rural ares, but engineers who, at best, are in suburban office parks.

Right now, I'm using the satellite data from hughes.net. Its not the high speed bandwidth advertised. The power supply was designed to be plugged into the wall. [that's a period] But if you live out here, you know the power goes out. but if you plug their power supply into your UPS, you find the damn thing blocks the next two backed up power outlets. Hello?

I've tried the 900mhz wireless transceiver. which needs a clear LOS (Line of Sight). I like living in the woods; and I'm not going to clearcut just so I can get a clear line of sight to the ISP transmitter tower. Hello?

I also have a place in a deep hollow by a spring fed trout stream. No way will any of the commecially available wireless transmitters work down there. You cant even use a cell phone. Hello?

No, I'm thinking about 180 mhz, kinda close to TV channel 8, but... out here, the nearest TV channel 8 transmitter is 300 miles away. Besides, TV antennas are being scrapped all the time; everyone is switching to Dish TV. Out in rural areas, RFI/EMI from ham gear no longer bothers anyone watching TV.

Besides, seems like there mite be pulse emitters/detectors that work at this speed. No Carrier wave, no IF. Technically, its *NOT* "radio". Ordinary tuners would ignore it; it aint AM nor FM. A 12 db antenna would be about 13' foot long. Awta go 30 miles to an ISP in some town that stays up serving users on the weekends. I've tried all three of the local small town ISPs, which have a nasty habit of crashing on friday nite, and not coming back online til monday morning.

I called "support" one time to bitch, and mentioned that I used Linux. The response: "What's Linux?"

But what's the best option to go from full duplex into the PC? will the standard LAN multiplex at 180mhz? RS232?

Y'know, in the "Hitchhikers Guide to the Galaxy" trilogy by the late Douglas Adams, there were three arks of humanity. The first was filled with all the thinkers. The third was filled with all the folks who got things done. The second ark, however, was filled with all the folks who didn't really do much for a living. They were the vice presidents of companies, the executive managers, the marketing people, the lawyers, the car salesmen, and the career politicians.

The second ark crash landed on earth. The survivors decided that if they were going to survive, they needed to build a committee to find figure out this "fire" thing. And the first question they asked was how were they going to market this sort of thing. Were they going to aim to build a pocket fire? Would people buy portable fires? Did they want them in different colors? How would they sell fire?

This is where you are. You know there is something out there that needs doing. However, you have no clue how to go about it. So you ask peripheral questions to see if anyone else is going to step forward and do your homework for you.

Honestly, there is so much to know and so much to learn that I couldn't possibly summarize it here. But to start you off, a router interface with a serial WAN port will work. So will SLIP on an RS-232 link. But I suspect you knew that already. Good luck building your radio. Be sure to post the details on the web if you ever get it to work...

Call To Arms, means, you will inspect your weaponry and prepare to do battle. Duty Stations, means, all men and women must assume their duty stations, weapons at the ready. Fire When Ready, means, man or woman your weapons, sight the target, finger the trigger, and fire when ready. Cease Fire Procola, means, continue fireing until the enemy targets are dispatched, and there is no sight of an enemy anywhere on the horizon. Procolas means, after ending all possiblities of any lingering survivors staying alive. It means to wipe them out, and leave no survivors.

This means, it is time to kill all Lesbianists, and all other enemies in my universe, the many groups of naughty kids in my universe, rascaleers and others, and we will continue this fight, untill they are all dead, and in my Epcot Centers, or untill they have surrendered. Rascaleers are evil people who wish only to harm others.

Religious Practices

This is a little confusing, but hold on, and I'll try to explain it. There are many parts to my religion. We call them, parts, but we can also call them, practices, some of them, but not all of them.

We have the fundamental 'root' practice, which is sexaling. From the root practice, comes all other practices.

There are side practices, and there are derived practices. There are also, accompanying practices. There are many other types of practices, but I don't remember the names for them all, right now, as I'm still amnesiatic, and will be for a long time.

Fistiker Practice

Bringing about orgasming in another person is a fistiker practice. A fistiker practice is a side practice, but it is also something a little different from a side practice, depending on how you bring the orgasming about, and depending on how many people are involved, and depending on who is the primary person, the person whom we are working on, and who are the helping people, the people who are joined together, to help the primary person to orgasm. There are a number of other dependencies as well.

What Is A Dependency?

A dependency is some thing that is needed that will help to define something else.

As in the case of an accident victim, we have a crutch to define one level of severity of an accident victim's situation. But we might also have a wheel chair to define another level of severity for the same, or other, accident victim. These objects help to determine how badly or miserably a person is injured.

A crutch can help define a level of severity in the injury. A wheel chair can help also to define a higher level of severity. These are both dependencies. They help us to define something, and they are used to help us to define an accident victim's level of severe injuries.

When Sexaling

You can use your lips, for example, or your tounge to twiddle the toes of a woman, and the woman begins to orgasm. That twiddleing of your tounge on her toes to help her to erotem, and to experience erotistical orgasming, can be any number of things, depending on the involvement and complexities of dependencies.

Rubbing the vaginal face, the vaginal wall, or rubbing to either side of the vaginal crevice, the labial folds or felates, can help a woman to erotem and erotistically orgasm, and depending on the involvement and complexities of dependencies, the dependencies can be any number of things, if we try to define the sexaling activity more fully and completely.

We'll skip this for now, as it is a little too difficult to remember, right now. Just remember, the primary practice is sexaling, and that sexaling is like the roots of a tree. All other religious practices grow out of the 'roots' of the tree, sexaling, and can be defined in many different ways, such as a helping practice, a side practice, a subsidiary practice, a canceling out practice, an accompanying practice, and there are many many other terms for what kind of practice some thing is, depending on what dependencies are involved.

Labia And Felate

What is the difference between a felate and a labia?

A felate is the skin tissue of the outer surface, and some of the tissue of the tips and edges of the labia. It does not include the inner side of the labia, but only the outer side, and the surrounding edges, as far as I can remember.

A verb, or action word, as I call it, is 'felate' as in 'Felate that woman's or girls' left felate'. That means to suckle on the left felate of the woman or girl.

Felate is a verb, but it is also a 'nominal' word, or naming word for objectifying an object.

Do we say 'Labialize that woman's felate!' To labialize something is to make something into a labia. We wouldn't, unless we were a doctor, say that about a felate. But we might say it if we were doctors, and we had a woman who met with a bear, and the bare clawed at her genitals, and the sharp claws ripped her labial skin up, then we might say in a surgeon's room 'Labialize that woman's ripped up labia.' That would mean to stitch it up, and make it nice and neat, and clean and well stitched up, and then useful to her, again, and it would involve a lot of surgery, as many nerves would need to be connected, as they had been ripped apart, and the wiring was all dislocated. But in the end, we would be able to fix her labia, and her genitals, if they were also hurt, and then we could dismiss the patient from the hospital, after the labia healed, and after she recovered from her trauma of having her labia shredded by an impolite, rude, mean, uncaring, and hungry bear.

Genitals, Titties, The Labia, And The Many Sexaling Organs

The labia is not the genitals, but some people do consider them as a part of the genitals. The genitals are inside the woman's vagina, in my way of thinking. The vaginal wall is not part of the genitals. The vaginal orifice is part of the genitals of a woman. This seems odd, doesn't it. Well, that is how it works, in my brain, and I designed women, as well as men. If you notice, in my writings, I've talked about the draft table, and the throttle. These are major parts of a woman's genitals. They are inside the vagina, and you can reach them through the vaginal orifice. Before you get inside of the vaginal orifice, there are a few things outside, such as a pee tube, and an ejaculate tube, and the clitoris, as well as the labia. These are not part of the genitals, but are working parts of her sexaling organs. A woman's or girls' sexaling organs are not equal to her genitals. Genitals are for baby making, and for other purposes. Titties are not part of the genitals, but they are part of the womans' sexaling organs. This will require a long discussion to clear up, so I will save it for another day.

Bears In The Woods

That's the way it happens some times, when women or girls go out into the woods, and sexal with their female friends. They can get hurt by bears, if they are not accompanied by men, who are tough, and strong, and who stay alert, to guard and watch out for dangerous animals, such as bears, wolves, cayotes, bobcats, puma, and even racoons. Racoons do attack humans, if they smell some thing that will taste good to the racoon. If a person has a skin tear, and is bleeding, even a tiny bit, the racoon will smell it, and come running, and then find the person, and so will panthers, and all kinds of animals will come, and it's just like a bunch of sharks and fishes of different kinds, and Moray Eels, they like the smell of blood, and they come and investigate, when they smell it.

Women and girls have periods, and it is not every twenty eight days, as I've explained about before, and blood runs down, out of their vagina, and they generally do not know it, as it is only a tiny drop of blood, or less, most of the time, and the blood is often wiped from the skin surface, when the woman or girl is on the potty, or toilet, and the woman or girl will not even see the tiny drop of blood that comes out of the vagina and drips down the labia, on the inside, and then falls or dribbles down to the felates, and then falls off the felates, while she is on the toilet into the toilet, or while she is out doors, and walking about, onto the earth, if the woman is walking on a park walkway, or bicycle path. If she is wearing underwear, it will not fall onto the earth, but it will dry up on the panties, or underwear, and the smell of the dried blood will attract wild animals if she is out doors, walking or jogging in a wooded or regional or rural area, where there are lots of, or even just a few, animals.

Pumas can smell the blood, from miles away, and so can tiny oselots, and bears, and many animals can. They can smell blood, because they know they need meat to survive. That is built into their brains, that are located throughout their bodies, and not only in the skull, and animals are very sensitive to the smell of blood, as well as to the smell of urine, and to the smell of poop. Some animals, such as racoons, will come up from behind a woman, and grasp at her panties, as the racoon may smell the odors of fecal matter, from her butthole. Men may be raked by the claws of raccoons from behind, as they smell the odors of fecal matter, and try to find out more about it, as the racoons know that there is something delicious hiding behind those odors from the buttholes of women, girls, men, and boys.

Expecate

When women and girls go out hiking, it is best to wash out the vagina, first, and then use a fermented oil, as a douching agent. The oil will help to slow the flow of the blood down the inner walls of the vagina, and it may help to trap the blood, and make it difficult for it to leak out, unless the amount of the flow of blood, is very large. In that case, it is best to stay home, and not go out, when a large amount of blood is expecated from the vagina. Expecated means to expell outwardsly. Expectate can also be used, as it is generally the same word, that is, and it also has generally the same meaning, but perhaps it has a few more uses, maybe, but it is from a variant language of the English language, and is basically the same word.

You should expecate your fluids in your vagina, from your vagina, before you go out hiking. If you know when your period is, and there are ways to tell when you have a period, or when you know when you are about to have a period, than if you normally have a large amount of blood flow from your vagina, as that has been your experience, it is probably best to go and sunbath at the beach, far away from wild animals and their habitats, or by the pool side. Racoons sometimes come out of the woods, to the shores of beaches, and trumbel along, listening and watching, and sniffing the air, when they smell dried blood, or wet or moiste blood, inside of the swim suit lining in the groinal area.

How Do You Tell When Your Period Is?

To learn when your period is, you need to look into the toilet bowl that you pee into, and then see if there is any red droplets. You can place a piece of toilet paper onto the surface of the water, and it might help to show the redish color mixing with the urine.

Another way is to take a piece of toilet tissue paper, and wipe your felates, in the morning, or during the day, or at night. Night is a good time, but during the day, it is just as good. Some women like night time because they feel the day is finished, and they are now going to make a final check. Well, it doesn't always happen the way we want things to happen. You might start leaking blood fluids, at two or three or four or five, a.m., or at six, or seven, or eight, or while you are in the shower, or in the bath tub, bathing, before you plan to go out for the day.

It may take you several years for you to find out when your period begins, and when it ends, by checking for blood flow. When you have determined the number of days between one period and the next, and you are absolutely certain of it, and you have confirmed it, many times, and you have checked to see if there might be something you didn't notice, at other times, when you checked, eventually, you'll learn when your blood flow begins, and how long it lasts, and when the next blood flow begins. Once you know, then you can time your excursions to the woods, or to the beach, with your friends, both women and men.

Bears, Wild Animals, And People

Men are needed to help scare bears away, if they come to close, and pepper spray is a good way to get them to leave the area. Bears do not like the small of pepper spray, and you need a cannister of pepper spray that will fire fifty to eighty to one hundred and eighty five feet or more, to scare away a bear, safely.

Loud noises surprise bears, but hungry bears get angry and feel challenged by you, and may come at you at a fast pace, and not stop, once they are angered. If you are a good shot with a rifle, and you see a bear, from a few hundred feet away, and it is moving slowly, towards you, following you, you can shoot it with a good fifty calibur weapon, from that distance, and it will go down, in an instant, if you hit it square in the noggin, about one inch or less above the nose.

You need to be a good shot, and several people should aim, and fire at the same time, to kill the bear, to be sure some one hits it, and then puts it down, and kills it.

Do not think that because you have one rifle, or two handguns, and a rifle, that you are safe. If you do not know how to shoot, and if you are an inexperienced marks woman, or marks man, than your chances of hitting the bear are near zero, for all three of you, at three hundred feed.

You need years of practice to become a good marksmen, and you can start with the lower calbur weapons, to get a feel for weapons that fire projectiles, and that make loud noises.

There is no such thing as a friendly bear, and people think, 'Oh, look! Isn't she cute, that bear.' If they think that way, they might as well have left their last will and testament behind, and signed all their assets over to another person.

Bears are animals that need to eat just as humans do, and just as all animals do. If you are so foolish to think that bears are cute, you are a lame brained idiot. Bears are dangerous animals. And so are all wild animals. If you think a racoon is a cute animal, you get the lame brained award for the year award, and trophy to sit on your desk at home to remind you of how stupid you are.

Brad Pitt, And Angelina Joline

Only idiots would think that wild animals, that eat people, are cute. They need remedial training, as they do not understand that their lives are in danger, every time they walk out the door of their home. Even in the cities, there are nasty people, who smile, and pretend they are your friends, and these same people, such as Hillary Clinton, Brad Pitt, Cheryl Davis, a friend of Brad's, but that's his current girl friend, Angelina Jo-line. She is not a Lesbianist, and Brad pretends to be her friend. He likes to watch her get eaten by bears, my abominant kids, when the Lesbianists feed humans, one at a time, to the bears, or to the crocodile abominant children of mine.

Abominant Elephant Kids

I have carniovorus, human being abominant elephant kids, and they are rude, mean, nasty, and really terrible. They scare people, and then they pick them up with their trunk, and place them on their head, and then they tell them not to move, or they will stample on them, or tromp downwards, and crunch them, painfully, from the foot, to the shin, to the thigh, to the pelvis, to the waiste, to the lower tummy, to the mid section, to the chest, and then the neck, and then the head, finally killing them. They will take a person, pull the person up and lift him or her up into the air with his or her trunk, and then pull the person into his or her mouth, and then crumple up the person, and then spit the person out, and the person is all broken up, and chewed up, with all the bones, broken, in the legs, and in the arms, and in the waiste, pelvis, torso, neck and shoulders, and head.

The Lesbianists use lots of these elephants. They are pretty to look at, but they are mean, and nasty. When strangers see them, they think, 'Oh, what a pretty elephant.' They don't know that the elephant is my abominant kid, and can speak English, as many people recently found out near Africa, in Sri Lanka, and then also in New Guinea.

They were very surprised at the talking elephant. But they didn't know that the Lesbianists had let the Elephant, my abominant kid, lose from the cages that they kept him sealed up in. There were one or two, or maybe eight of them, in Sri Lanka, and eight or nine in New Guinea. Lots of people got eaten up, and killed. The elephants are still lose in New Guinea, but in Sri Lanka, they herded them into the pens, and brought them to New Delhi, to then begin a rampage in New Delhi.

Well, the Lesbianists are doing this, daily, because they feel they have lost this battle, and that they are just wasting time, doing nothing, as they can not get to me. So they want to have a lot of fun. Now they are releasing lots of my abominant kids, in many places, and in New Delhi, Bombay, Sri Lanka, and New Guinea, many people have been hurt and killed by these idiot kids, these abominant elephant kids of mine. The Lesbianists have thousands of animals they want to release, out into the public, in England, in Switzerland, Georgia, South Carolina, Paris, and many other places.

The Lesbianists think they are going to have a lot of laughs watching the abomniant kids of mine, tear people up, and rip them to shreds. They also think that the animals, who are not abominant kids, but are just bizarre animals, that catch people in very large, nets, that have threads as thick as ropes, and that are very sticky, are going to do a lot of wierd and crazy things, no one here on this planet, other than them, have seen. They think they are going to get a lot of laughs when they see the mayhem and havoc, the disruption to society, and frustration on the faces of people who get caught in the nets, and then turned into living mummies sealed up in a type of pulpyish paper so the person can slowly disolve, but stay alive, for up to a year or more. Maybe as long as ten to thirty years, in some cases, and I'm not kidding.

You may think I'm kidding, but I'm not. This began a few days ago, and the Lesbianists are intent on continuing this, for the next few years. Isn't that surprising. I never expected that. They are very strange people, aren't they. They are real sicko's aren't they.

I think you should all go and meet my kids, with a day pass, and ask them about it. Other wise, you might find your self in a very large spider's web.

Labiating A Labia

To labiate is to suckle the labia, and to take one or the other of the labia into the mouth, and tickle it with the tounge, or twist it gently with the lips.

'Labiate that woman's left labia!' 'Felate that womans left felate!' The difference is, labiating is to suckle the entire left labia, inside or under the edge of it, on the inner side, and the edge of it, and the outside of it.

Felateing the felate, is to suckle the edge of the labia, the upper exposed edge. It does not include the labia, in its entirety. Only the upper, protruding skywards, or in which ever direction it is pointing, that portion of it that is extending outwards. If you lift it up between your finger tips, you'll pull up on the entire structure revealing the underside, or the unexposed underside of the labia.

There is also the outer side of the labia.

The Felate is the top tip edge of the labia, generally speaking, and it is itself an isolated system, and not part of the labia. It's connected to the labia, but it serves a different function. It droops downwards, to seal out the possiblity of any thing entering the vagina from below, in an upwards moving manner. Bugs can not fly up into the vagina, as the felates prevent them from flying up into it. Without the felates, the vagina would be unprotected. The labia would not protect the vagina, as the labia is merely the skin tissue mass that the felates are attached to, and in an instance of removing a felate from a cadaver, or dead body of a woman, or girl, once the felate is removed, the labia have no closure over the vagina, in most women and girls.

There are exceptions, as we've had many animals in our heritage line. There are many differences when we line up ten women, and inspect their vagina, their felates, and labia, their bumbey pack, as children are encouraged to call the lower hanging sexual organ of the vaginal cape, as it is also called by doctors.

On this planet, the bumbey pack may not be called a vaginal cape, with the inferior texts with unadvanced, primitive, witch doctor level sexual sciences that do not help any one along, such we find with the myth that women and girls have a period every twenty eight days.

That is total nonsense, as I've explained about it, before. The truth is, every few days, to every eight to fifteen days, to even eighteen days, or evern thirty two or fifty five days, depending on where the woman has grown up and where her ancestors have grown up, the number of days between one period and another period can be very dissimilar, from one woman to another woman. Some women have a period every two or three days, or even every day. There is no reason an ovary can not fall, every day, several times a day.

An ovary is so small, no one can see it, without special optical technologies, such as pass through see through technologies, and other optics, and other videoing technologies. A microscope is an out moded, ancient, and novel device, fit for only museum use on display shelfs. It's like an old car of the twenties, or there abouts, or even earlier, of course, depending on how sophisticated it gets. Micron microscopes, the so called, 'electron' microscopes, are a misnomer to begin with, as an 'electron' is not a fictious concept, but no one knows what an electron is, generally speaking except for the Lesbinists.

An electron is a small bit of electrically heated plasma, that you can heat, with the right technologies. It can fit on the tip of a pencil or pen. This is a big joke to the Lesbianists, as are also their jokes about protons, and neutrons, and nuclei, or the so called combined nucleus, as in 'nuclear' family. Nuclear family, is not a 'tight' organization of two persons, and their children.

A nuclear family is a family that has been nuclearized, that is, exposed to radiological salts kiddies, and their radiative or radiological energies. That's another one of the Lesbianists' jokes on all of the scientists who the Lesbianists could get to swallow it.

What Causes A So-Called "Nuclear' Explosion Or Detonation?

A vast number of children are making babies at a very high rate of speed, and the energies that they give off, as they make babies, and then peel off from the area where they made their babies, one after another, as they rocket away, is what causes a nuclear blast. The tummy mommies and tummy daddies are making babies at such a frantic pace, they make millions and billions, and trillions, and more, before you can even send a signal to your eye lid to blink, from your brain part that sends the signal out. The signal will travel just a very short distance across a crupture, not even half way, more like, one or two feet in distance, if we are to look at the size of a crupture as the same size as our current universe. It travels about not even one foot, not even one inch, and not even one millimeter, and not even one millionth of a millimeter, and far smaller than that still, before the parents are already through making babies, and they have retired, and passed on, and several kabillion generations of families, and multiply that by a very large number, and you'll get how many generations of families lived and died, and passed on their DNA to their sons and daughters.

It's a hail storm of erupting magnitude when the tummy mommies and tummy daddies begin making babies, and making their families larger.

It all happens so rapidly, with more than that number of successive generations of families, in less time than the energy pulse will travel down an optic nerve, across a crupture, that very minute or very tiny distance, as I stated above.

That kind of frenetic baby making activity, makes for a lot of heat, as well as, it generates a lot of stresses, and a lot of energies go flying off in all directions, as the sexaling couples experience many nice orgasms and eroticisims, together.

Temperatures, their body temperatures, collectively, and the incredibly vast number of movements, which also generate temperatures, by the animals, the tummy mommies, tummy daddies, tummy babies, the relatives, and the many generations of families, go skyrocketing, and the magnitude of numbers, and the intensity of all the activities the animals are busy with, as they make tummy babies, simultaneously, or nearly simultaneously, is of phenomenal proportions.

If we slow them down, to our pace, and then compare them to our pace of life, they would be just like us, and things would move slowly for them, and not much would change, for many kazillions plus years, and then many, many more years.

However, they are moving so much faster than we are, and the length of time they live, to them, it is a long time, four or five, or eight or nine hundred years, in our time, maybe, in some cases, depending on the type of radiological salts kiddies making babies.

On their scale or pace of life, they live that long. But on our scale, the length of time they live, is so tiny, we can not measure it, unless we have a very high level of advanced mathmatics that can account for such a small time period, or span of life.

Anyway, the frenetic adventures of the colony of radiological animals, when they start to make babies, after they are woken up, and prompted to make babies, with a detonating surge of heat energies, light wave energies, pressures energies, trampolining energies, which get them started, with the right combination, of heat, light, atmospheric temperatures, atmospheric pressures, food sources avaiability, drinking water avaiablity, trampolining energies, and a number of other types of energies, that awaken them, and then get them turned on, and sexaly active, they will suddenly erupt into a frenetic, mass of baby making furor, to us, any way, and with that, we have our so called, 'nuclear' detonation.

Cleansing Your Self With Your 'Built-In' And 'Attached', Cleansing And Washing, Clearifying And Erasing Energies Producing Genitals And Sexaling Systems, Eroteming And Orgasming Nervous Systems, And Baby Making Related Purifying Energies Generation Stations Aparati, Or Apparatuses, And Armatures

You women and girls, your vagina is your Holy instrument for assisting you to cleanse your self, and wash away the dirt and grime of daily living, the insults to you from strangers, the verbal abuse you experience in your arguments and conversations with friends and family, neighbors, relatives, work associates, and community acquaintances.

Your Holy body is a weapon to fight back against all the negativities you experience in your life, as you orgasm and erotem, showering off purifying energies, and lots of other beautiful other things and dings, as you vibrate your entire body concordially, in harmonic rythym, cadence, and rapture, with my Holy Body.

Your breasts, your butty butt, your butty butt hole, your vaginal hole, your groin, your throes, your vaginal cleavage or labial folds as they are called here by these nitwittish doctors on this planet, who do not know any thing about the human body, your chest, your back, your legs, your arms, your hands and fingers, your ankles, feet, and toes, your ears, lips, mouth, tounge, cheek, your rectal cavity, your tummy button, your stomach, throat, your brains, and you have many more than just one in your body, but many millions and more of them in your body, and that is not an overstatement, and every part of your body, inside and out, your many nervous systems and all your organs, they are all set to orgasm and erotem, and generate purifying energies with the help of the power company, as I've explained about them, before.

Ticklement Tuning Forks

You have ticklements, tuners, or pitch fork tuning forks, that chime, in every cubic millimeter to every cubic inch, and in even tinier places, you have tinier ticklements, or tuning forks, and in larger areas, you have larger ticklements, or tuning forks, and they are all set to vibrate in various patterns of sexual thrilling eroticisms, and orgasming ecstacies, as you pump up the levels of sexalating energies you have available to you, in you, and showering off from you, and those patterns and focal points change, slightly, minutely, as every micro second goes by, as we change our location in our universe, and our relative location or position to every thing else in our universe changes, from night to day, and from day to night, ongoingly, non-stopingly, never repeating the same set of tuning focal patterns. Focal patterns are frequencies.

Focal Patterns

These frequencies, or harmonic consistencies, are harmonic displays or the 'in rythm' with GOD, consistencies that allow you to be united with GOD, me, my devine and holy body, and my devine and holy mind, and being or GOD SELF and GOD BEING, every moment.

Men and boys have the same ticklements, or tuning forks, and they are located in every organ of their bodies, just as they are in women's bodies and in girls' bodies, and they allow all of you children of mine to stay in frequency with me, as you sexalate, erotem, and orgasm, practicing my religion, and as you live your daily lives.

These many ticklements and tuning forks are all connected to your brains and to your nervous systems, and each living being in your body, has them as well, and every living being has them as well.

All my children, animals, living beings, and human beings, are all connected to me, through these tuning forks, and also, through the holy bodies all my children have inside of them, and also through a myriad of other mechanisms that I have functioning in your bodies, in your astral 'energy' bodies, and the many millions of energies bodies each of you have in you. My animals children and living beings childrens have fewer connectivities and fewer energies bodies, as they do not need as many as my human being daughters and sons. This is because you, my human being children, need to be more connected to me, as you are the only ones who can actively practice my religion, with your own self determination, and desire to practice, to become closer to me, GOD, purer, and holyer.

I'm connected to all of you, day and night, three hundred sixty five days a year, in countless many fold untold numbers of ways and manners, and with countless many fold untold numbers of mechanisms. All of my children are likewise connected to me, in similar ways and manners, and with similar mechanisms.

As you women, girls, men, and boys sexually rapture, erotem, orgasm, and reach sexual peaks, and then sustain them, you grow holyer, as you become purer, brillianter, and closer in GODLYNESS to ME, GOD.

Obviously, then, the primary means for you to grow pure and holy is to sexalate, and as you continue, over the days, and weeks, then months, years, decades, hundreds of years, thousands of years, millions of years, and more, you slowly grow more pure and holy.

Sexaling is my primary and most fundamental religious practice and your primary religious practice for you to become cleansing machines, washing machines, purifying and sanitizing machines, so that you can clearify and erase your karmic markups, and purify your lives, and the lives of those around you, with your selfless actions of grace and serenity, sexaling and showering purifying energies in all directions for the sake of your self, and for the sake of others.

You women and girls need men and boys to assist you to become the powerful cleansing and purifying machines that you are capable of becoming.

Men and boys used to be somewhat nearly as useful as purifying and cleansing machines, as women and girls, but men and boys have different jobs, and different priorities, and there fore, the burden of work to purify my universe, and to clearify the karmic markups of all my children rests on the shoulders of all women and girls, with men and boys assisting women and girls.

You men and boys need women and girls to lead you, and to help you to become more proficient, powerful, and more capable cleansing, washing, purifying, and sanitizing machines.

Assistive Religious Practices

The practice of praying Nam Myeo Ho Ren Ge Kyeo is an assistive practice that allows you to become in touch with my GOD SELF, equally as well, but the time it takes, is much longer, as very little purifying energies are produced, merely by using your brain, muscles, ligaments, sinews, bones, mouths, tounges, and jaws, as energies sources.

There are many other assistive practices, from meditation, to breathing techniques, to yogic techniques, to ballet like techniques, to dance techniques, to body movements of various kinds, to help you to increase and or also store up your energies, and then for you to release them, for you to then become more firmly and closely connected to ME so that you can eventually begin to gain a higher appreciation of ME, GOD.

My many religions teach many ways to do this, and before my many religions were corrupted by the Lesbianists, they worked to varying degrees of success.

Therefore, sexaling is the primary fundamental religious practice, and all other practices in my religions that I've taught over time, spanning all of my previous teachings from the begining of our time together, since I, my GOD SELF, created you as my children, are assistive practices, of one kind or another.

Sexaling, eroteming, orgasming, phlumetting are important practices, and as you orgasm, you are purifying your self, and others by pushing out and spraying your self with purifying energies as your holy and sacred energies shoot out to cover you and emmerse you in full body coverage, from head to toe, showering and shattering energies every where around you. They then build up and cover over all others who are around you, as well, with your purifying erototistic and orgasotistic purifying energies, clearifying yours and their karmic markups.

Astral traveling is another type of practice, but we'll define it, another time. Experiencing hyper trance states of mind and being, and a nearness to GODLYNESS are also a practice, and we'll define it, when I can remember every thing I need to remember about it.

Participating in my religious ceremonies is an assistive religious practice you can enjoy, as you become purer and holyer, and after you recognize that I am your Mother and Father, and your CREATOR, and that you exist because of me, as I made you from pieces and parts of me, your CREATOR.

After you realize this, you can enjoy participation in ceremonies with me, as training priestesses and priests, and you can make your way up the purity ladder, the more you participate with me, GOD, in my religious prayer hand signaling ceremonies.

Praying Nam Myeo Ho Ren Ge Kyeo to my Holy Body, or to the Gurkian Mandala, as I've explained about, is an assistive practice that will bring results.

It will not bring results as well and as effectively and as quickly, as sexaling, which is the most holy and virtuous practice, along with eroteming, orgasming, phlumetting, astral traveling, peaking, and so on.

I've spoken about peaking, before, and women and girls can peak, and experience wonderful feelings.

In any case, do not confuse assistive practices, with the fundamental and primary practice of sexaling. We'll get back to all those other things, to define them, betterly, another time, after my brain heals, a little bit more, and after I erase more karmic markups that keep my brain karma from improving, fast enough for me.

How To Make Prayer Statements

Remember to include a prayer statement, such as 'I pray to the holy ephemeral body of the Creator, John Francis Ayres, for the [insert private prayer statement]', such as, '... for the serenity of mind, and the gratefulness of heart, for all those around me, who have helped me to become the person I am, and can become.' or, '... for the peace of mind, and serenity of heart, for the love of all men and boys, and the cooperation of all women and girls.' These prayers said by a woman or girl. Men can pray, similarly, '... for the grace and deviness of the women and girls who surround me, I am greatful to them, and I pray for their continued good health, and prosperity'.

You can also say, 'I pray to the holy body of the Creator, John Francis Ayres, for the [insert private prayer statement]', but only when I am in the middle of a religious hand signaling prayer ceremony, i.e., while I am doing a prayer ceremony, and saying my prayers with religious holy hand prayer signals that my special kids who are religious kids, can pick up and then act on, in concert with other groups of kids of mine, who also are religious kids, most of them, I think, and who work together with my primary groups of religious kids.

I have lots of kids, and some are normal kids, who go about their jobs, as expected, for earnings, just as most people we know. But I also have lots of other groups of children, who are more, religiously oriented, to varying degrees, and who are very religious as their work is all for the sake of my religious self, my GOD SELF. My religous kids catch my hand signing, and then they pass the messages along to others of my groups of children, and with all of the different groups of children I have doing 'good' works for me, as well as groups of children who do 'religious' works for me, as well as groups of children doing normal work for me, but for the sake of my religion, nevertheless.

They all coordinate themselves, somehow, I have yet to figure out how they do it, but between them all, they get the jobs done, that I ask them to do, while I am religiously - and the prayer statements I am signing are very holy - hand prayer signaling, i.e., hand signing.

So, unless you know for a fact, by seeing me on a tv, such as during a live broadcast, once I get my religious conveyance set up, and built by my children, after all the conditions are met, for securing this world from the grasps of the Lesbianists, and after killing all the Lesbianists, and / or after making the remaining Lesbianists surrender, and then after all other conditions are met, as I don't know all the conditions, I've set, as my memories are still foggy, as I'm amnesiatic, as well as mentally retarded, but in any case, if you see me on tv, on a live broadcast, doing my hand signing, you'll know I'm in the middle of one of my prayers, and then you can say, 'I pray to the holy body of the Creator, John Francis Ayres, for the [insert private prayer statement]', and you can omit the 'ephemeral' if you like, as it will work better if you omit the word 'ephemeral' as while I'm praying, I'm my normal, GOD, self, though I may not look to you, on the surface, to be any different, over the video links, or even in person. It never the less works better if you use my recommended methods of making prayer statements, this way, for you to maximize your private prayer statements.

All of my groups of kids have lots of friends, and they do lots of work for me, and I do not remember how many groups of them there are, and how many children I"ve got, as yet, but in time, I'll be able to give you a better idea of how they work together to get the work done, that I ask them to do for me, with my religious hand prayer signals, or hand signals, as in hand signing, or signing.

My kids use signing for all their work assignments, so I use hand signing that they can catch, pick up and read, and it is all pretty much very religious in nature, and it is very solemn, as I am GOD, and when I'm signing, they know I'm GOD, and do not doubt it.

When I am not signing, they might now and then, doubt that I am GOD, but never the less, I am GOD, and my signing proves it to them - when I am saying my religous hand prayer statements, by hand signing - with out any room for doubts in their minds.

In other words, I'm a typical person, just a little mentally retarded, brain smattered, or brain damaged, after my many youthful and other brain bashings I recieved, the wiring is a little scrambled up, upstairs, and after many poisonings by the Lesbianists - from makeing coffee from kerosene, diesel fuel, gasoline, and motor oil contaminated coffee beans and then from drinking that coffee, without knowing it was contaminated with petrol fluids, as often happens to people - and with ill health karma that has me on disability, and I've been through a lot, life after life, and sometimes, my children may have had a thought or two, 'I wonder, if he is going to make it, like he said he would?'

Well, to dispel all doubts, I sign, and when I'm signing, I remind them of my old self, back in the old days, when I used to sign, religiously, and they know how serious a guy I was, so they do not harbor any doubts, so long as I am hand signing.

What To Say, When You See Me Using My Dick Or Other Parts Of My Body To Purify Others, And So Forth

You can say, 'I pray to the holy body of the Creator, John Francis Ayres, for the [insert private prayer statement]', also while you see me praying, Nam Myeo Ho Ren Ge Kyeo, or also while you see me in a ceremony, using my dick and scrotum, or other parts of my Holy Body to purify others, during the middle of a prayer ceremony, and I need not be hand signing, or praying Nam Myeo Ho Ren Ge Kyeo, as I am in the middle of prayers and activities ceremony, which is just as good as a religious hand prayer signaling ceresony, any day.

My dick and scrotum package is very Holy, and it has a very useful function, and that is, it purifying others. My lips do, too, and my butt hole, does as well. They all purify others very effectively and efficiently during my religious ceremonies.

My entire body, during a religious ceremony, butt hole, mouthal hole, lips, tounge, cheeks, legs, knees, feet, toes, butt, chest, back, arms, elbows, hands, fingers, head, neck, throat, ears, nose, and so forth, is entirely the body of GOD, as I am GOD, and therefore, while I am useing my body, during my religious ceremonies, and for my religious ceremonies, and you see me on tv doing so, then after you have verified that I am in the middle of a prayer ceremony, you can say your private prayer, in the manner as I've explained, 'I pray to the holy body of the Creator, John Francis Ayres, for the [insert private prayer statement]'.

I only use my dick and scrotum package for prayer ceremonies, except when I need to pee, so if you see that I am using it, during a prayer ceremony, or if you see me using any other part of my Holy Body, during a live broadcast prayer ceremony, then you'll know right away, that I am in the middle of a prayer ceremony and it is okay to use the statement, 'I pray to the holy body of the Creator, John Francis Ayres, for the [insert private prayer statement]'.

The same is true, pretty much, for any priestess or priest, who practices with me, in my religious holy body prayer circle, their bodies become very Pure, Holy, and Devine, but only after many life periods, that is, after many, many aeons, as they do not attain the same level of purity for a while, the same level of purity as I am at by my good old self, or the same level of pureness that is of ME, GOD, since I'm GOD, and they are not.

That means, it takes priestesses and priests longer to become pure, holy, and devine. I happen to be pure, holy, and devine, but that's because I'm GOD, and it is only during my religious ceremonies that you can understand that as you make your prayer statements, and sexal, etc.

After a long, long while, priestesses and priests will also become pure, holy, and devine, as their holy bodies, energies bodies that are pure, holy, and devine, but on a lower scale than are MY energies bodies, since I'm GOD, and I'm in charge of keeping things tied together, here in my universe.

After many aeons plus years of practice in my holy body praryer circle, the priestesses and priests become pure, holy, and devine, and then their bodies, their normal bodies, become very purifying, just as mine is, now, when I am in a prayer ceremony. I am in a prayer ceremony, daily, a few times, to a number of times, a day.

I've gone eighteen hours straight, once, and no sooner than I go to sleep, and then wakup, right away, I begin again, and I've gone many days, straight, praying, continuously, non-stop.

This is nothing, though, and is all preparatory, as in the future, when I get my health back, as I haven't been too healthy, for quite some time, I will be praying around the clock, some days, and for many days at a time, taking a break only to eat, drink, poop, pee, and clean up.

When priestesses and priests join with me, we will go for years without stopping, and with the priestesses, and with the priests, the both of them there, present, doing the prayer ceremony on my behalf, they can represent me, while I take a nap, go and shower, get some food, nourish myself, drink some fluids, read a book or news paper, or watch the news, or a movie, game show, video, or play a video game, and so forth. I won't be taking long breaks, and that is very funny sounding, but anyway, it happens that priestesses and priests will lose their attention, and then get lost, somehow, and then go and watch tv in their bed room, or whatever, and then we have to go and look for them, and they will get a few markoffs, and with enough markoffs, they will be asked to leave the religious conveyance, and they will be put on a type of vrobatiton, or under survielance, to see if they are good or not. My kids do all my survielance work, and they keep track of every one, so 'you'd better be good, you'd better be nice, you'd better look smart I'm telling you why, Santa Clause is coming, to town'.

Who Was Kris Kringle?

Did you know that Kris Kringle got its start from me? What a coincidence. I don't think he was wearing anything, though, or rather, I don't think I was wearing any thing, but you never know, as tolerances have changed over the long aeons of time, as they pass.

When priests and priestesses become that pure, holy, and devine, as pure, holy, and devine as I am, after their many aeons of religious practice in my holy body prayer circle - pure and devine on the exact same level as I am at - then they can represent me, as Mr. mini-GOD, and Mrs. mini-GOD.

You can not represent me as Kris Kringle, and whoever my wife was, back then. I think I had a lot of guys on that team, and a lot of women and girls, too, since sexaling was a part of that religion, too. You can learn more about it, if you're interested, by getting a day pass, and checking in with my kids, and then, signing up and joining our country, and then by becomeing a citizen, as I've spoken about, before.

You can include any good prayer, that comes to mind, that you feel is needed by you, to improve your life, and to level up your life.

You are the only ones who can pray, and practice, you women, girls, men, and boys, and there fore you are connected to me in many more ways than other living beings, the animals, and the amoebes, cells, and other living beings.

There fore, you are, both genders, the ones who will clean up the mess you have made, and you will continue to keep my universe clean, as you sexal with your genitals, and with your bodies, and with all your gizmos, igniters, trigger mechanisms, love bumps, love patches, tuning forks or ticklements, and so forth, as you are sexaling beings, who I, GOD, created, and you will sexalate, erotem, orgasm, phlumett, astral travel, peak, hyper tranceate, and so forth, just as I intended you to, from now till forever.

You will become virtuous and worthyable beings, worthyable tummy mommies, and worthyable tummy daddies, with your practice of my religion, who will bring into my universe, my many children who will join with you, and assist you and me, in cleaning up our universe, and the mess you have all made of it.

Is that understood? The answer had better be, "YES SIR!".

Lesbianists' Torment Campaign Under Way

Lesbianists are clearly releaseing wierd, ghastly, horrible, and dangerous preditorial animals, giant insects, giant spiders, giant lizards, snakes, and reptiles, ghastly, preditorial sea animals and sea mammals, winged, preditorial and horrific, aggressive scavenger and killer buzzard like creatures and other winged and destructive animals, and other horrible creatures, as well as my abominant kids to kill, maime, torture, and cause major disruptions and suffering to people, around the globe, in many locations.

Apparently, the whole world is now affected, or will be affected, by this dischordance and disharmonic display of defeated lunacy.

The peace has been shattered by the Lesbianists. It was not good before, the situation in the world, with the balooneying governments of the world, doing what they wanted to do, and torturing, and canabalizing people, and feeding people to my abominant cave bears kids, and to my crocodile people kids, and mistreating people, like Bill Gates, Steve Hawkins, Steve Irwin, many women, young girls, and men.

The war in Iraq, the phoney Saddam Hussein Trials, and all the bogus manipulation of the press and media, and the suppression of what is actually the case, with our being used and abused, poisoned, and maltreated by the Lesbianists, was a rotten situation. That was normal, or normality for us. Our karma is very poor, and we have the karma to suffer this abuse, and these torments, daily, unknowingly, in most if not nearly all cases.

But, it is becomeing really bad and there is need for serious concern, and action, to correct this situation. It has gotten out of hand, completely, and there is no stopping the Lesbianists in their wanton, and coldly miserable wish and lust for chaos and disturbances to others.

Now, more clearly than ever, as the Lesbianists rampage, the Lesbianists are causing major disruptions, suffering, anguish, and there is just an awful discordance of shock, dismay, and misery, that is growing, every moment. This is as real as the sunlight shining from the sun on a hot day in summer.

I don't have a clue what people are doing, and what is happening to them, as they are captured, tortured, and caused miserable sufferings, in many places. There must be horrible agony for many people, at this moment, and as each moment passes.

Our reality as it was has suddenly been shattered and torn up, and replaced with the lunacidal, Lesbianistic, mayhem and chaos.

Reuters reports a Lesbianists' joke for the Lesbianists, sarcastically and ironicly stateing, "New Perils Push Doomsday Clock Closer to Midnight" "(Reuters) Scientists have advanced the clock 2 minutes closer to midnight."

http://us.rd.yahoo.com/my/today/
new_perils_push_doomsday_clock_closer_to_midnight;_ylt=AmUXlewr5ev2kNK_SfOHDFAL1vA
I/*http://news.yahoo.com/s/nm/20070117/us_nm/doomsday_clock_dc_4

This is their private joke, to make this scenario more laugable than before for them. They could not care less, as they are manipulating every thing, and that statement is completely meaningless to them, as they are in control of every thing, in their conspiritorial lunacy to rule human beings, and to trash every one.

We'll see what the coming days, weeks, months, and years bring, and maybe there will be hope for change, when people begin to take action, to correct this situation, globally, united in spirit, permanently.

These are the most evil of evil people and abominant kids, in our immediate vicinity in our universe. We must begin our cleanup campaign here, as it begins where I am, and will continue from here on out, till we have rid my universe of all of these horrible people, and all others like them, and have made them surrender, or have sent them on to my Epcot Center.

I will establish my relgion in my universe, and begin my ministry, and they are not going to stop me, as my religion will bring positive change for all of us, forever.

I must establish myself outside the bounds of this Lesbianistic society, so your efforts and concern for our future, and your selfless giving of donations to my ministry, to allow me to set up my ministry, outside the bounds of this Lesbianistic society, non-dependent on Welfare, Supplemental Security Income or SSI, Medicaid, and non-reliant on the supported and financed Housing and Urban Developement or HUD subsidized apartment that I live in.

Once I receive in the mail, the 'Gift' donations to set up my ministry outside the bounds of this society, I believe things will gradually begin to positively change for us all, and the shift to positivity will begin, and a new universe for us all, will become for the first time, ever, a potential reality with the sincere religious practice by all of my followers, all of you, who are practicing my religion, diligently, and daily, or as much as your health and your time permits.

There in, with your efforts to practice, will bloom your flowers of dignity and hope, justice and freedom, willingness for sharing, cooperating, and participating with others in our new age of enlightenment, the Gurkian Age, and your new found respect for self and others.

Captain Off The Bridge.

John Francis Ayres
GOd
And Children

It Is Now Time To Kill All Government Workers, Public Workers, Preachers, Islamic Clerics, Christian Bible Teachers, Bible Thumpers, And All Other Persons Who Support The Lesbianists And Their Lesbianistic Societies Around The World - 'Fivers' To Kill Lesbianists And All The Lesbianists' Supporters - Coma Patients - All Persons Who You Kill Will Transel To My Epcot Center - Japanese And List Keeping - Surrendering And Pledging To Serve All People In My Universe - What Does This Mean? Updated: 21-01-07 Rev.d.01.a 19:56 PST

It is now time to kill all police of every police department in every country in the world. It is now time to kill all jail and prison workers in every country in the world. It is now time to kill all zoo keepers who work in zoos and other related places around the world. It is also time to kill all pet store personel, and pet store owners. We do not need people housing and feeding potentially dangerous animals. You are further ordered to kill all pets in all pet stores, and elsewhere, even in private homes. You may then eat them, after you have cleaned out their guts and removed tummy foods and rectal feces, etc., that are decaying matter, that is harmful to your health, and after you have prepared them for eating by cooking, grilling, fire place cooking, barbecuing, smoke house fermenting, or by other safe and sanitary, healthful cooking methods.

It is also time to kill every fire department official or worker, no matter what capacity the person works in, as a fire truck driver, as an ambulance driver, as an assistant driver, as an attendant or support crew person, as a maintenance man of the fire or the police departement, it is now time to kill them all.

Further, it is time to kill all public bus drivers, who work on any metropolitan or local area or state or interstate, or national bus company. It is time to kill all ships' captains and their crew members. It is time to kill all railroad rail line workers. It is time to kill all subway drivers and subway line workers, no matter what their job is.

Further, it is now time to kill all military personel, SWAT team personel, all government personel, and all civilian, or trained military, national guard, state or federal militia, toy soldiers, the people who dress up in old time war regalia, and outfits pretending they are old time, earlier period, confederate soldiers, or old time earlier period, union soldiers, who act out old time North the 'Union' vs. South the 'Confederates' and who participate in city and town parades, across the United States.

It is now time to kill all retired military personel who support the deranged, crazed, insepient, and corrupted Lesbianistic societies we live in, around the world. It is also now time to kill all persons who in any way support the governments of the world, including but not limited to, all school, university, kindergarden, missionary, day care center workers, nursery school teachers, teachers aids or teachers assistants, United Nations workers, United Nations teachers, substitute teachers, catholic school teachers, Irish protestant school teachers, parochial school teachers, all religious denominations around the world school teachers and their school support workers, government funded school teachers, tuition assistance by the government school teachers, all personel who work for the United Nations, all civil service agents, all DEA agents, all FBI agents, all FDA agents, all EPA agents, and workers, BLM agents who are Lesbianists as well as those BLM agents' who are Lesbianists as well as those friends of theirs, who support the Lesbianists.

It is also time to kill all other federal, state, or local, or globally tasked organizations, such as the CIA workers, INTERPOL workers, the several groups of workers within the Canadian Mounties, NIC a spy department of the U.S. Navy, the Korean C.I.A., the United States Presidential Police agents the Secret Service Agents, National Park Rangers, State Park Rangers, Forestry Service workers, Pentagon workers, National Library Of Congress workers, and all others who work in any capacity supporting any government organization, those listed above, and all others, as well as all persons who support the Lesbianists in any way at all.

It is now time to kill all judges, bailiffs, Supreme Court Justices, and the employees who work in their organizations, and all other judges, legal clerks, para legal workers, court stenographers, justices of the peace, lawyers, attorneys, state attornys, prosecuting attornys, defense attornys. It is time to kill all officials of all government organizations, and all the people who work for them and or even only support them, such as restaraunt workers who feed them lunch, coffee shop workers and owners who feed them coffee and food, bars and restaraunt personel and owners of bars and restaraunts who support and feed any and all persons connected to the governments of the world and who work for them in any capacity at all.

It is also time to kill all the money lenders who loan money to the Lesbianists, the mortgage company owners who provide the Lesbianists with house purchasing loans, and all the supermarket workers and supermarket owners, who supply food to the Lesbianists, as well as all of the druggists, the pharmacy workers, who supply medicines to the

Lesbianists. It is time to kill all the taxi cab drivers who give rides to the Lesbianists, and to every person who supports the Lesbianists in any way, at all, unless those people surrender to my kids.

It is also now time to kill all civilian or civil servant or state civil servant worker who supports in any way, any Lesbianistic organization, such as the police departments, federal agencies, fire departments, libraries, schools, and so forth. It is also now time to kill all persons who maintain or provide services to any of the above listed organizations, and to all of the similar organizations in every country in the world.

This is my order to all of you, and you are all ordered, by me, GOd/GOD, to kill all of them, unless they surrender. People also call me, 'Allah'. I'm the same person. Just do as I tell you.

You are to take my fuels' bombs with chlorine plastics' explosives formulas, and all other explosives formulas I've explained about on my bulletin board and the fuels' bombs explosives formulas including but not limited to radiological 'fracturable' rocks that provide so-called 'nuclear' explosions, all of my bombs' formulas, and all other bombs' formulas derived in part or in whole from what we have learned as I've explained on my bulletin board and to take them, and make the bombs and explosives, and to then use them, and then destroy and kill all of the Lesbianists, and all of the Lesbianists military bases, buildings, and kill every last one of them, all of them, leaving no one alive.

'Fivers' To Kill Lesbianists And All The Lesbianists' Supporters

You are to then make certain they are all dead. If they are not dead, you are to kill them with a 'fiver'. A 'fiver' is a bullet with five lines drawn or scored with a knife or sharp instrument into the tip of the bullet, to form a 'five' line pattern, so that the bullet will fracture into 'five' parts.

You are to take three 'fivers' and shoot each person who has not stopped breathing, and who is not dead yet, and shoot the three fivers into the head of the person, to make certain the person dies.

Three 'fiver's will destroy enough brain material, to kill any person if the bullet is large enough, and the handgun, rifle, or weapon is powerful enough.

The handgun bullet size must be at least larger than a .22 calibur, and at a minimum, 7 millimeters. You may use .38 calibur, 9 millimeter, 10 millimeter, .45 calibur, or any other, large sized bullet to make certain they are dead. Buckshot, 8 guage to 10 guage, or any comparable rifle load or handgun load, or home made weapon load, will work equally as well, with three shots into the skull. A machete or similar instrument should then be used to chop the head off of the person at the neck line. If you have a machete or hatchet, or axe, and if you prefer to chop off the head of the person, then by all means, you are to do so. The point here is to kill the person one hundred (100) percent, and not leave the person in a coma.

Coma Patients

A person in a coma is perfectly alive, and can hear every word you are saying, but can not respond. People in a coma after severe accidents, such as near fatal traffic accidents, where their limbs were broken into pieces, or war victims, who are on life support in Veterans' Hospitals, can be in agonizing pain, and no pain medications are given to the patient as the patient has no way of communicating with the doctors, nurses, or staff members to complain about the pain, in many or in most cases, if not nearly all cases. Some patients can write or scribble out a note about the severe pains, or make gestures with their hands, pointing at painful spots they are able to point to, and then making squeezing motions, to indicate as best as they can, that there is something wrong in the area. Some people may catch the meaning of the gestures, but others do not, and may just wonder what is going on with the patient and they may wonder what the patient means by the hand gestures. Others, doctors and nurses, and staff members will merely find it amusing that the patient is making the gestures. Some doctors and nurses, and possibly staff members, will figure out the patient is in pain, and then steps can be taken to alleviate the pain, but it is an ordeal for the patient, and it may take months, or in some cases, years, before staff, cleaning persons, food servers, orderlies or assistants, nurses, or doctors figure out what the hand gestures mean.

The coma patient, after healing from the injuries, may still have residual pains, such as residual spinal pains, or neck pains, or ligament pains where ligaments were twisted, or ruptured, or severed, partially or wholly, and the ligaments didn't grow back properly, or didn't grow back fully, or much, or perhaps, in some cases, not at all, which does happen a lot, and each time the patient is moved in her or his bed, the person experiences extreme pain as no medications for pain are given to the coma patient, unless the patient has been successful in communicating that there is pain felt by her or him, in her or his body.

Leaving coma patients on life support systems is the cruelest thing you can do to a person in a coma as there is no such thing as being 'brain dead'.

It is a cruel and abominable Lesbianists' joke on humanity, and on all persons, that the Lesbianists have perpetrated with their teaching doctors and nurses that coma patients are brain dead, and do not feel, hear, taste, or sense, anything at all, and it is just another one of the Lesbianists' ways to hurt and torture people, and cruelly and ruthlessly abuse human beings, in this case, in most of these cases, by proxy. There are doctors who are Lesbianists, and I have one who is one, that I am aware of, and he knows exactly what causes my health problems, but he sits there, non-responsive, and with a vacant stare on his face as if he doesn't hear, see, or know of any thing that is going on, something like the three monkeys with hands clasped over their, ears, eyes, and mouth, who represent 'hear no evil, see no evil, speak no evil' and then 'therefore, every thing is alright'.

All persons with brains, whether in a coma, or other sleep like state or condition, is perfectly brain alive as the brains and nervous systems, auditory, taste, touch and sense nerve systems, never die, until the patient stops breathing, and passes on.

All nurses and doctors are to remove all life support systems from all persons in a coma, immediately and confirm the persons have died. That will allow them to transel into my Epcot Center, and then be born again, as a tummy baby to a tummy mommy and to tummy daddies.

All persons in a coma, whether in a hospital, or in a nursing home, or at a private home or apartment, or in a group home, or group care center, are to be told the truth of this, and are to be told that you just leared it, and are to be told that I am GOD, and that I have an Epcot Center staff waiting for them to come in, to be treated for their traumatic condition, of not being able to do any thing about their condition to end it, as it is a miserable situation for these people who are in a coma, or in any trance like state or condition that resembles a coma, or a sleeping person, who can not wake up. The person is perfectly brain active, and there are no measuring devices to prove it available to hospital staff or to doctors, as none are made, and the technologies to detect a person's brain activeness and aliveness are kept secret after they are bought up, and then after the records of them are destroyed, and the information on them are kept secret and locked away, in vaults, and in storage facilities, hidden from view so that no one can get the information, and build a device to detect a person's brain alertness status.

After they are told the truth, and that you just became aware of it, you are to tell them to not be afraid, and that all measures to relieve them from their present condition, and all measures to assist them to transel to my Epcot Center, where they can recieve personal care, and then helped to recover from the trauma of the coma, or coma like state of not being able to wake up, speak, and talk to people. They are then to be injected with a powerful sleep sedaditive, or induced to swallow several strong sleeping pills, as they may become afraid, and then, you are to help them to pass on, and to transel over to my Epcot Center.

In some cases, if you pull on the large toe of a person, or on the thumb, the person may have control to pull in the opposite direction. That is an indication that they are awake, and fully aware of what is going on around them. Please check patients to see that they have soundly fallen asleep, and snoring or breathing quietly, in relaxed manner, may be the only sign that the person is asleep.

Any sign of movement, mentally driven by the patient, no matter how slight, is nearly most always, nearly one hundred percent of the time, a sign that the person is completely brain alive, and that the person is completely aware of what is going on around her or him and can hear every thing. Even passing or expelling gas or farting, can be 'mentally' driven, and a sign the person is awake, and alert, and brain alive. Opening one's mouth is almost always, one hundred percent of the time, mentally driven.

Persons's in a coma, who have Eplilepsy, or other similar brain or neuro muscular disorder, and other conditions where patients experience spasming, whether the condition is diagnosed or not, these patients who spasm, may make some spamodic movement, now and then, and that is only a sign that the person is haveing a neuro muscular muscle spasm. Knee jerks or other similar movements, are not always muscle spasms and can be labored, mentally driven actions. These actions show the patient has control to that extent over her or his muscles, body, skeletal system, and other body systems related to the movement.

In any case, after the patient has fallen asleep, you are then to kill the person, and let the person transel to my Epcot Center, so that the person can recover in my Epcot Center, and then be born as a tummy baby, to a tummy mommy, and to tummy daddies.

All Persons Who You Kill Will Transel To My Epcot Center

Once you are certain all of the police, fire, teachers, and all others who support the Lesbianists' societies around the world are dead, they will transel to my Epcot Center.

It is now the time to bring an end to the lives of these people who support the crazed, insepient, bogus Lesbianists, and to destroy them all, leaving no survivors. Kill all of their family and relatives, and leave no one alive. Kill them all.

My Epcot Center will not be in any way, inconveinced by your brave and heroic actions. All doctors must be killed, all nurses must be killed. All medical techinicians must be killed. All library workers must be killed. All school teachers must be killed. All art museum and gallery museum workers must be killed. All workers for all of these institutions must be killed. All of them, in every country of the world, unless they surrender and plead for mercy, and then are allowed in to my kids' place, for swearing in and for joining as civilians, my country.

Further, it is time to kill all media corporations personel, such as news casters, news men, news women, anchor persons, cameral men and women, talk show hosts, administrative persons, Hollywood's movie actors and actoresses, all radio broadcasters, and all personel of all radio companies. It is time to kill all news paper company owners, and publishers, editors, and all workers of these companies, unless they surrender to my children and plead for mercy.

It is time for all of you to kill all of them, and make sure not one of them is left living, including and most importantly, all politicians, who must all be killed, without any further delay. It is time to kill them all.

It is now time to kill Oprah Winfrey, Geraldo Rivera, Sarah Jessica Parker, Judge Judy, Jerry Springer, Liz Taylor, Michael Jackson, Clint Eastwood, Cher Bonno, Morgan Freeman, Steven Spielberg, Al Gore and his family, Hillary Clinton and her family, all of them, Jeb Bush and his family, all of them, Nancy Reagan and her family, all of them, former president of the United States President George Bush, Sr. and his family, all of them, including all persons related to him in any way, and all persons who work for him, in any way, and all persons who work for any of his associates, in any way, unless they surrender to my kids, and then plead for mercy.

We are not going to allow the Lesbianists to continue their illegal, inhumane, and horriblesome practices and activities on my planet, and in my universe, a moment longer. They must all die, now.

Is that understood?

I hope the answer is, "YES SIR! Mr. John Francis Ayres, GOd", as a 'negative' reply to my question is not acceptable.

Japanese And List Keeping

I haven't confirmed it, but from what I know, so far, the Japanese are very good at keeping lists, and they know about all the foreign people in Japan, and they keep lists of names of all of them, and they keep lists of names on all of the Korean people, and the Singaporean people, the Chinese people, the Ainu people, and the cast outs or 'burakumin' a group of meat cutters and fish sellers who some how got on a list of people who were felt to be 'unclean'. The 'burakumin' was a group of people who no one in Japan wished to talk about. The Japanese also, apparently, had lists on groups of people, who they didn't know much about, but they knew they were always doing things with each other. Those groups of people were the Lesbianists, so the Japanese knew all along, who I was talking about and were nearly one hundred percent certain those groups were the Lesbianists living in Japan.

They read what I wrote, and the notes of mine were passed to many people on an e-mail mailing list, and when they heard that Steve Irwin had been killed, they felt they had heard enough and they told all their friends about my notes, and then the Japanese killed all the Lesbianists in Japan on that list they kept.

It's something I heard, and I haven't confirmed it, but I think the Japanese are fully capable of handling that, as they were fully prepared to deal with each one of the Lesbianists, and they knew who they were, and once the Japanese united, and decided to take action. The Japanese escorted all the Lesbianists to a meeting place, to which the Lesbianists were not happy to go to, but had no choice but to agree to follow the Japanese citizens who escorted them there, with the military or Japanese Self Defense Force, the Coast Guard, and

National Police, and all other police agencies in Japan, plus the national organization of fire department workers, backing and supporting all the Japanese citizens.

As to what they did with the bodies of the Lesbianists, I'll leave that to them to explain to you, as it was quite brilliant and they had many very good ideas for dealing with the bodies of the deceased Lesbianists, who are apparently now in my Epcot Center.

The Japanese country side is now peaceful and quite, and things the winds are blowing, peacefully, and gracefully over the Japanese country side, cities and towns, across the ponds, marshes, lillies and lotus flowers swamp lands, bogs, bays, estuaries, lakes, streams, rice paddies, fields, mountains, and islands, from what I can understand and gather about the situation in Japan.

Surrendering And Pledging To Serve All People In My Universe

If the Lesbianists and their supporters surrender to my children, and then promise to devote their lives for the sake of others, serving man kind, and all human beings, and all people on this planet, and in my universe, for the rest of their lives, they will be allowed to surrender to my children, and my children will then arrest them and put them in a prison cell. If they are not willing to serve others, despite the fact that they say they will serve others and devote their lives for the sake of others, serving all people in my universe, then my children will ignore them, and my children will not arrest them because my children know they are lying. They must promise to do all they can that is humanely possible, for the sake of others, and devote themselves to the prosperity of others, for eternity. If they are not willing to do that, then please, just send them on to my Epcot Center, and we'll straighten them out, for there. My staff at the Epcot Center has training programs to straighten them out and make them nicer people, so that next time they are born as tummy babies, they will behave and be nice to others, doing nice things for other people, after they are retrained, a little. The retraining program takes a while, but the results are very good to excellent.

If my kids decide that the person who is surrendering, is telling the truth, my kids will use the special teletransportation technology, something like what we see in Star Trek on tv, with Captain Kirk saying, 'Beam me up, Scotty!', as many of us have seen on daytime tv, or in the movie theater, and my kids have very good teletranportation technology or 'beam me up, Scotty' technology, and the person, once he or she pledges honestly to serve others, will instantly dissappear.

Do not be surprised if when the person surrenders and promises to 'serve others', promising to devote her or his life for the sake of others, the person suddenly dissappears, and instantly, the person is no where to be seen. The person was 'beamed' into a prison cell that my kids have constructed, using other technologies, and we have many prison cells waiting for the Lesbianists and for the Lesbianists' supporters, and for other bad kids in my universe, as well.

For each person you kill, my kids will keep earning points scores on your efforts to send them to my Epcot Center, and you will be paid, when you have finished your job, and then finally, go in to visit my kids. My kids will pay you in the monetary currency that is used in the underground cities my kids have built, for protecting people from these horrible Lesbianists and for protecting people from the abominant kids of mine, and the ghastly and naughty animals and very large bugs and spider like creatures, that the Lesbianists use to help them torture people with, to make the Lesbianists laugh, and to amuse themselves, as I've explained a little about, already. The more Lesbianists and Lesbianists' supporters you send to my Epcot Center, the more earning points you will score, and the more money you will earn, and you will be paid that money, when you go to visit my kids after you have finished your work, killing the Lesbiansts and the Lesbianists' supporters.

If the Lesbianists and the Lesbianists' supporters do not disappear after they surrender, and after they promise to serve others, and pledge to devote their lives for the sake of others, the Lesbianists and the Lesbianists' supporters are lying, and you can then kill them, and send them on to my Epcot Center.

My children will escort the deceased Lesbianists and Lesbianists supporters, once you kill them, into one or an other of my Epcot Centers, and will make sure that the Lesbianists and the Lesbianists' supporters get in for a meeting with one or another of my managers, or with one of the staff members who work with my managers to arrange retraining programs for rehabilitating the Lesbianists and the Lesbianists' supporters.

The Lesbianists and Lesbianists' supporters will not qualify as tummy babies, until they are finished their retraining and rehabilitating programs. After they finish, they will be out, again, to join the rest of you, once again, but this time, as nice, kind, courteous, and polite people.

What Does This Mean?

It means, I want all the Lesbianists dead, but if they will surrender, and if they promise to serve all human kind, all people, and work and strive to enrich the lives of all others, dedicating their lives to others, then, you do not have to kill them, and you do not have to send them to my Epcot Center. If they are honest when they surrender, and when they promise to serve all people, devoting their lives to all people of the world, then my kids will 'beam' them in, using the teletransportation technologies that my children use. If they are lying, then my children will not beam them in, and they will be stuck where they are. If they are stuck where they are, after they surrender to my kids, and after they promise to dedicate their lives to the welfare of all others in the world, and to all others in my universe, then they were lying, and you may then kill them, and send them on their way to my Epcot Center, for retraining, and for rehabilitation.

It also means to kill any person who works for the Lesbianists, if he or she is supporting the Lesbianists to try to stop you from killing the Lesbianists. Also, it means that you should kill any person who tries to interfere with you, while you are trying to kill the Lesbianists.That's what it means.

Fermenting Oils - Fracuses Kiddies - Slugs, Snails, And Other Bottom Feeders - Feeding Everybody In Our Bodies - Putting An End To The Global Menace Of The Lesbianists - Changing Our Societies, And Our Universe, Forever Updated: 22-01-07 Rev.x.00.a 07:45 PST

Mix raw sugar, ocean salt, sessame seeds, dried fermented berries you have taken from a mix of berries fermenting as a flural hydrate liqour, or as a plain fermenting liqour, and make sure you dry them out in the oven, before useing them.

Mix the items together in a container, and mix in a drop or two of apple juice, pear juice, papaya juice, kiwi juice, banana juice, cherry juice, cranberry juice, strawberry juice, peach juice, nectarine juice, or plumb juice, and let the moisture settle into the mixture to allow it to become only partially and only very slightly moiste, and not wet or liquidy.

Allow the mixture to sit in a warm or cool place for a week or two, to eight to fifteen weeks, or even a few years, and it will grow molds in it, and with the longer the duration up to a point of sitting and molding, the more useful it will become.

It might develop a pungent, unpleasant odor, like a dead animal smells, which may mean that a fungus that is not very suited for you to use as a starter mold for starting a fermented oil batch has developed in the container, and in that case, you can throw the whole mix out, or use it for fermenting beans or something. Cheeses can be made with these kinds of growing funguses and molds, if you are the daring type, who likes to experiment with new and different tastes from variously fermented mixtures.

You can add some ocean salt, and make a soury vinegar, and then try to rescue it with the combination of the soury vinegar, ocean salt, and a little raw sugar, and some honey.

It may be that some bacteria is in the mix, and it needs to be eaten up, before you can use it safely for a healthy mold mix for starting a nice cheese molds and funguses mixture.

Ocean salt can be added in slightly large amounts with raw sugar. Once the odors have stabilized, and once they have developed a more pleasanty odor of a fermenting mixture, with a slight alchohol ferment odor that will indicate that it is alright to use, and that it will not be harmful to you.

In some cases, the bacteria in the base mix, may be a result of hairs or particles of skin from the body of a dead rat or mouse, that some how found his or her way into the sessame seeds, or into the dried spices, or into dried berries that you used, and then died.

In that case, you might as well throw it away, unless you have a lot of patience, and do not mind waiting and working with it, for several years, for it to become something you can use.

One way to make it into something you can use is to mix in a high potency liqour brew, and let it sit for a number or years, and ferment it, and then after it smells nice and rosy smelling, after ten to fifteen years, to thirty to fifty years, you can evaporate the liquids out in a pail on an open porch that has a net covering to keep animals and animals' hairs out of it. Make sure there is good ventilation, and it should evaporate out, safely after a number of days on the porch in the sun. If there is no heat to make it hot enough to combust, and if there is good ventilation, it will not combust, and it will evaporate out, safely. Adding ocean salt and raw sugar to the mixture so as to fill it up with raw sugar and acidic ocean salts, will further help to safely evaporate out the liquids and prevent the liquids from combusting, accidentally.

Once the liquids have evaporated out, safely, you can use the materials that remain in the pail or container, to start a fermented oils brew mixture, or to start a cheese molds and funguses mixture, if you wish to make a nice cheese molds and funguses mixture.

The particles of skin or hair from the dead rat or mouse, or pidgeon, or other animal, will have been eaten up by all the ferment fracuses kiddies, and will no longer pose a threat to your health.

Fracuses Kiddies

Ferment fracuses kiddies are just plain old ferment kiddies who like to devour large bits of human or animal tissues, mites, or cockroaches, or their body parts, and then poop them out, and pee them out into the liqour brew.

You'll always have some of these kiddies in your brew mixes, and they are useful to you, as they eat up the things that you do not want in your tummy. Also, there are other kiddies, such as snails, and other bottom feeders, that find their way in, in the skins and pulp material as tiny animals, or the eggs of animals, and they hatch, and they develop, and they grow big, and they then bottom feed, and they eat any dead rats, and dead rat parts from rats that might have fallen into the brew. These are useful pets, that you want in your rum and liqour brews, as they will keep the liqour brew healthy to drink, and they will keep you from getting ill.

Slugs, Snails, And Other Bottom Feeders

In the old days of bucanneering, as I may have mentioned, before, this was a crucial part of keeping the sailors alive, on their long voyages, and if crew members fell ill due to an unhealthy brew, with a dead rat in the mix, making it sour, and making it unhealthy to drink, then if there are not enough snails, slugs, and bottom feeders in the barrel or rum to eat the dead rat parts, the sailors will get ill, and when they get back to port, they will hang the rummery owner, and give the business over to the son, or to a third party, often times, one of their fellow crew members, who is liked by all the people, locally, and on the ship.

This is the case, still today, with many rummeries owned and handed down in the same family, from such instances as that.

Bottom feeders, slugs, snails, and many types of bottom feeding earth worms, and other types of healthy bottom feeding worms, that cohabitate well with the slugs, and snails, and other animals that are too tiny for you to see in the rum brew mixture, without a powerful microscope like, optical videoing technology, are essential to your brews mixtures, and they may increase in numbers as they make babies like every animal and living being does, and so now and then, you need to reach into your brew container, with your hand, or with a fine mesh small aquarium use fish net, and scoop them out, and flush them down the toilet, or let them loose in a local pond, lake, mountain stream, or water springs fresh water well, where they will help to keep the water clean, ahd healthy.

Once you have the materials to make your fermented oils mixture, you can add them to your container of food oils, and begin to ferment them, or use them to make a nice cheese mixture, to ferment and then to make solid as it matures with age. You can also use the materials to make a fermented bean mixture, or fermented barley, or fermented rice, or fermented millet, or fermented wheat mixture.

You can also use them to make a fermented brew mixture, as there will be many healthy molds and funguses kiddies in and among the dried out materials. Your health will improve, and by adding different spices, nuts, berries, root particles, ground up kiln dried pine cones that were green to begin with, and then fermented for a few months to a few years, in a brew mixture, then dried out, and ground up into a saw dust powder consistency, you can then have lots of crystals cages salts kiddies of various kinds help you to make a nice regroverative brew, to help you to regroverate your amoebes.

Feeding Everybody In Our Bodies

You know, we need to eat foods to stay alive. We also need to feed all the living animals in our body, to help them to stay alive, so that they can help our health remain normal, from day to day. We also need to feed the amoebes all the foods and juices, salts kiddies, and the poopy liquids and pee liquids, and other liquids with other types of tinier salts kiddies in them, as well as other types of food kiddies, we haven't learned about, yet, but with all of them inside your tummy, you'll be able to feed every one who needs feeding, and then you'll be successful with your amoebe 'auto regroverate mode, on!' formula, so long as you have degunked your body of all the petro chemical oils, kerosene, diesel fuels, and other chemicals, the Lesbianists have been feeding you, from birth, in your diets, if you live in a society, where you are fed baby formula mixtures from Gerbers or Heinze, or any of the other baby foods manufacturers.

Putting An End To The Global Menace Of The Lesbianists

We need to put an end to this practice by the Lesbianists of poisoning us with their petro chemical industry oils and tars salts kiddies, which they use to rot our teeth out, and cause tooth decay, and which they use to cause ulcers in people's tummies, and which they use to cause lots of unpleasant illnesses, and diseases in human beings, and in farm animals. These petro chemical salt kiddies, and formaldehyic salts kiddies, all harm our amobes living beings children, and all the other animals that live inside of us. One day, we will have a lot of people practicing my religion, sexaling, and making prayer statements so as to help us to erase the karmic markups we have, that keep us living under the tyranny of these Lesbianists, and in their societies, suffereing the daily poisonings that cut our lives short. When we have erased enough of our karmic markups with my religion's religious practice of sexaling to purify our selfs and others around us, and to clearify and erase our karmic markups, we will eventually be able to say good bye to the Lesbianists, and their practices of poisoning us, and causing us major headaches, or problems in our lives.

Changing Our Societies, And Our Universe, Forever

At that time, we will be able to say hello to a whole new way of life, and that will be the beginning of our new, thrilling, and excitingly challenging, one world, unified, planetary, global culture, and it will be the begining of our new, thrilling, and excitingly challenging, one universe, universal culture for all of the people in our universe, who we have been living in our universe together with, since we first came out, and began living here in my universe, a very long time ago. We have to start somewhere, and so here we are, now, begining to prepare the foundation for our long and prosperous journey ahead of us, as we clean up our universe, together with each other, and clearify and erase all of our karmic markups, and all of the karmic markups of all my children, and of all living beings who live with us, together with us, in my and our universe. We need to take responsibility for this clean up campaign of ours, as we are the only ones, besides my many worker, unionized children, who can use our brains, and use our sexaling organs, to produce purifying energies of all types, to help us clearify and erase all of our karmic markups, and all karmic markups, and karmic things and dings, of all of my animal children, and of all of my living beings children, and of all of my human children.

My kids have built underground cities, to help us to get started, in learning about the new ways of living together, and of sexaling together, for practicing my religion together with each other, so that we will be able to prepare ourselves, for our new global, unified society, and for our new, universal, united, civilization. We have a long ways to go, but we are starting now, with your efforts to correct this situation by eraseing the karmic markups and karmic things and dings, that have us living in this truly awful situation on this planet, in our universe, that we are now, curently living in. One day, when all the Lesbianists are either dead, or have surrendered to my kids, we will be able to gradually educate ourselves, and change our understanding about women and girls, and about men and boys, to understand the truth about women and girls, and about men and boys, and then we will begin our new and exciting journey into our future, together, with my religion at the basis of our new, unified society, universal culture, and universal civilization.

Donations To GOd

Why can't anyone donate any thing to me? I am GOd. So, how come no one can send me a penny in the mail, or a box of cookies, or a pair of socks, or something? I don't think I'm asking for too much, but I'm just curious about why no one can send me anything in the mail?

I don't get any phone calls. No one sends me any e-mail. No one tries to visit me. I have a religion, and I'm asking people to practice it. Now, how come no one can contact me?

I once said that I am in a monastic mode, and it is a cloistered monastic mode. That means, no one can be contacted out side of my monastery by any one inside the monastery, and no one can contact any one inside the monastery, by any one outside the monastery.

If there is no legitimate monastery business then no person will be allowed to contact me, or for that matter, any one else inside my monastery, who is leading a monastic life, with me.

Well, there is only me, right now, but maybe in the future, some one will be in my cloistered monastic discipline with me, helping me with my religious duties of doing my religious ceremonies, as I've mentioned about, before.

Monastic Mode

What does my 'monastic mode' mean? It means that I am here as GOD. You know, there is only me. I of course never sent any one, such as the Lesbianists claim. Why would I? I don't need any one to do the things I need to do. That's sheer idiocy to think I would have a son or daughter, and send them to do my business. That's absurd. You've been snookered into believeing all those hogwash tales, and now you don't know who I am, and you don't have the karma to believe in me, as a result of your following and believeing all those hogwash tales. My kids are everywhere, and they are doing their jobs.

Who Works For Me, Anyway?

Now, as I've been saying, I'm going to have you do your jobs, and that is to use your genitals, and to use your body, and to use your brains, and then participate in my religion, using your genitals and your body and your brain, and sexalate with each other, and purify your karma? Does that sound like a joke to you? If it does, you are very mistaken because it is not a joke in any way, and I am absolutely serious when I say that you are going to use your 'equipment' and I almost want to call it, your 'field' equipment, because you are armed with it, day and night, and you are going to use that equipment, to clearify and erase your karmic markups, and to purify my universe. Is that okay with you? I hope it sure the hell is, as a "NO SIR!" at this point, would be an unsatisfactory reply. Do you understand me? I hope so. You are going to jump ship, as I order you to, or be thrown over board, if you have a problem with that. I hope you understand.

Well, as far as I can figure it, no one realizes that I am GOD, so no one can donate money to me. If some one realizes that I am GOD, than for the first time, that person will be allowed to donate money to me. That person will be allowed to visit me, or call me on the phone, or donate money or food to me, or practice my religious ceremonies with me, if that person believes, and understands, and realizes, that I am GOD.

Right now, there is no one who realizes or understands that I am GOD. No one of course believes I am GOD. Never the less, I am GOD, and I am sitting here, waiting for donations, to help my ministry get started.

So, that is the reason that no one can get through to me, or donate money to me, or send me a postcard with some kind of message of cheer and support in it.

There doesn't seem to be any body who believes that I am GOD. Well, that isn't surprising. People do not have the karma to believe that I exist, is one way of looking at it. They have ignored my existence, and have not had any real thoughts about me that would link them to me, in my monastic mode.

What does that mean? It means, that no one remembers me, as the guy who created all of you.

It also means, that I am in a religious mode, and no one understands that, or believes that I am in a religious mode.

That is peculiar, since I am giving you a religion, one of my oldest, for you to practice, that will assist you in purifying your life, and that will assist you in eraseing and clearifying your karmic markups.

That's very peculiar, but it is not that peculiar, as you do not have the karma to realize and understand that I am GOD.

In any case, there will be no donations, no telegrams, and no phone calls or letters to me, so long as you do not realize, understand, and then of course, believe that I am GOD.

Well, any way, so it goes.

Obeying Orders

Now, I want all these people, killed. Hillary Clinton. Bill Clinton. Chelsea Clinton. Ted Kennedy. Al Gore. Tipper Gore. Harriet Gore. Cheryl Gore. Dave Gore. Bill Gore, and all people who call them selfs, Gore and pretend to be related to Al Gore, or to Tipper Gore. Mr. Al Gore has lots of friends, who are also Lesbianists, and I want them all killed. Oliver North. Monica Lewinsky. Eve Arden. Elizabeth Arden. Michael Jackson. George Bush Sr. and all other George Bushes. Do you understand what I mean? It means, that they are all Lesbianists and they are all going to die, and we are going to blow up Washington D.C., and destroy Capital Hill, and level that area, and make it sink beneath the waves of the Atlantic Ocean. That's how big a bomb I want you to make, with my fracturable rocks, to then blow that area out of the water, and make it sink below the waves of the Atlantic Ocean. You'll probably need more than one bomb.

Did you know that Washington, D.C. is lying on a fault line, deep down, and it is on an ocean shelf, that has the ocean under it, lapping at the earth, very far down. That means, that it is on a fault line, and it is on a shelf, that is hanging over the ocean's waters.

Now, if you hit Baltimore, and Maryland, and Northern Virginia, and Washington DC with a large enough bomb to blow Baltimore out of the ground, and level it, and with another bomb large enough to blow Washington DC out of the ground and level it, at the same time, and a few more bombs, large enough to blow Maryland, Virginia, and that whole metro area out of the earth, at the same time, you will sink the nation's capital, that is, Washington DC, below the ground, as it will break off the ledge that it sits on, and it will sink into the ocean, as the ledge crumbles below it. There will be water, from the Atlantic ocean, all the way out to West Virginia.

Now. I have every right to say that, and demand this, as it is a matter of self defense, as I know these motherfuckers are eating people, cannibalizing my kids, for their amusement, thrills, and fun, and they will continue to do that UNLESS THEY ARE STOPPPED! Do you understand that?

I hope so. I am going to see the whole of Washington DC and the area leveled, with Baltimore, and Northern Virginia, and Maryland, as well, and we are going to sink that area into the ocean, and make it disappear below the surface of the waters of the Atlantic. Now, that should be clear, shouldn't it.

This is not a joke. We will have to send a lot of my children to my Epcot Center, in the blasts that will occur, and in the after math of the blasts, but that is unavoidable.

We will have many people, drowning in the waters that come in from the ocean, and that stretch out to the hills of West Virginia, with only slight outcrops of land, hills, here and there, with a few people lying on top of them, blinded and in awful pain, but they will not live long, as they will not be able to survive for long, and they will pass on, die, and then they will transel to my Epcot Center, where they can get medical relief, medical treatment, therapy counseling, and rehabilitative therapies.

Now, that is what we will do to Washington DC and vicinity, so every one, please prepare for it, and get your pain medication in order, so you can take an over dose of pain pills, when your area is blown and shredded to bits, with one or more of my fracturable rocks bombs, as I've explained about.

Every Politician In The World To Be Executed

Next, I want every politician in the world, canceled out. I want their passports for living on our planet, canceled. That means, I want you to kill each and every one of them. Not only do I want you to kill them, all, but I want you to kill every single one of their associates, around the world. They are all Lesbianists, except for a few of them. If you happen to kill one of the non Lesbianists policitians by mistake, that is okay. They have the option of surrendering to my children, available to them, and once they surrender, they will not be killed, by accident.

Every Hollywood Actor And Actoress To Be Executed

After that, I want every Hollywood actor or actoress killed, and that includes all the actors and actoresses, around the world, and they must surrender to my kids, if they wish to not get killed. There are a lot of them, who are not Lesbianists, so those I've mentioned, who

I've let you know are not Lesbianists, you can forget about them, and leave them alone.

There are more than a couple of billion Lesbianists living under the earth's surface, in underground cities. I did not realize there were so many. We need to kill them all, so we will, in time, unless they surrender.

Is that clear, every body? I hope the answer is, "Yes, Sir!" as you had better not answer any other way, or you will get yourself on my shit list. Is that understood? Good. I am the boss of my universe, so if you do not like it, than jump overboard, now, sailor. Have you got that clear? Good.

Jump Ship, Explained

What does 'jump overboard' mean? It means you are going to have severe problems with me, if you do not obey orders, and that there will be difficulty and jail time, ahead of you, if you continue to ignore my commands to you. It means there is going to be trouble, if you do not obey me. My kids are in charge of handling all the details on that, and it is not a joke.

Fair Warning

We are not going to let these Lesbianists run their show, one more minute. We are going to put an end to them, and their activities, here on this planet, and every where else in my universe, and this is fair warning of that.

Particle Remis Technology And Particle Dismiss Technology

As I said, once before, there is a technology called particle remis technology. There is also a technology called particle dismiss. They are the technologies that you can use to feed 2.3 billion Lesbianists down under the surface of this planet, and on every other planet that they are on.

Dismend Technology And Remend Technology

It is easy to dismiss molecules, and to dismiss, or dismend all the beings who need to be dismended, and sent to my Epcot Centers. It is also easy to remend them, and then get them back into the foods that I need them to be a part of.

My kids keep track of every one who needs to be dismended, and then remended. That is a lot of work, keeping track of every one, but that allows us to dismend the living beings, and animals, that I can let off from duty, and from further service, and then send to my Epcot Centers for them to live in. I can then recall them to duty, and remend them, and then have them serve in an apple or an orange, or banana, or a brick. Do you think that is a joke? It is not a joke, and there is no joking allowed, on my shift. Do you got that? I hope so, because if you do not, you will have to learn how to swim a long ways, as it is going to be a long way from shore, after I ask you to jump over board, and I have sailors who practice, all the time, just to show the passengers how it is done, just in case. I will have you jump from ship, if you do not get along with me, and if you disagree with what I am doing, pretty soon, as we are departing, now, or just about now. That means, we are not going to play around, much longer, and we are going to set sail. That means, there are going to be a lot of people practicing my religion, pretty soon, as they will learn about it, and they will begin practicing it.

Mentalcosis / Mentaltosis And Comatosis

Mentaltosis is the state of a vegetable, like a stalk of cellery, or a plumb, or an orange. Comatosis is the state of complete awareness of self and others. Comatosis is not brain dead, i.e., more or less, mentaltosis, with no real significant brain activities occuring, other than the ones that keep you alive, and vegetative, and you do not need assistance to remain and function in a state of mentaltosis, and the Lesbianists know it. You are severely brainally handicapped, and when you come out of it, eventually, after you have your karma fully completed for being mentaltosically ill, and after it is then time to get on to something else, you will be very brainally handicapped, and you'll be an extremely retarded person, with little to nearly no brain awareness going on about self and others, but able to walk, barely, and later, after many many lifetimes as a mentally retarded individual, you'll begin to be able to mumble a little, or babble a little, for umpteen lifetimes, as you begin to get your higher brain functions, back, which takes a very long time to work out, and many many lifetimes to work out, karmically.

Comatosis is like a hit on the head, and when you wake up, your faculties are not all working, and you may not be able to speak, or move, or talk to your friends, but mentally, you are all there.

Mentaltosis is like a train ran over your brain, and every other nervous system in your body, nearly, and you are completely unable to think, or do any thing else, and you are reduced to a mere pumping heart patient, with not much else going for you, except you are breathing, and technically, you are alive. You can sit there for a million years, or a million or so life times, before you begin to come out of it, and then reveal your disorder of severe mental disorganization, mental disfunction, and mental retardation. There is a big difference between a bonk on the head, and a train running over it, and the rest of your body. Coma patients are fully aware of what is going on around them, and they may not be able to speak, but they are there, and they can twitch a finger, now and then, or flex a toe, or raise their tummy up a tiny bit, to pass gas, usually, and relieve the bloating sensation they are experiencing in their tummy, and in their intestines, or colon. They may be able to grasp your hand, and fully hold on to it, and not let go, for hours, if they have the strength for it. This horrible torture the Lesbianists are perpetrating on comatosic patients, needs to end, now. Person responsible for continuance of hospital policies, despite our informing them of the truth regarding this, are to be shot and killed, and sent to my Epcot Center, if they interfere with the removal of the life support and life support assitive devices, that are plugged into the comatosic patients mouth, or nose, or other orifice of their body, or any part of their body. If some one refuses to cooperate, you are to throw them out of their hospital unit, and give them a good whack on the head. Come back in a few days, and then disconnnect their life support assisitive pumps, and tubes, and so forth, and shoot them in the brain with three 'fivers', as I've explained about, and then send them on their way to my Epcot Center. That is an order. Now do it.

I want you to pull the plugs on all the GI's and civilians who are on a breathing assistance machine, and life support assistance equipment, and I want you to send them all to my Epcot Center, where they can get treatment, and therapy, and then get themselves ready for being born, again, as a fine and a healthy, tummy baby to a tummy mommy, and to tummy daddies. You had better comply, if you know what is good for you, as my kids are now keeping track of your records on this account, and you are not going to do very well, if you do not follow orders. Is that clear. I will not have any insubordination of duty on my watch, and that means, you had better learn to follow orders, or you will be asked to jump over board, and then go for a very long swim to shore.

Michael Jackson

Michael Jackson is the biggest joke in the world. He is a white boy, and he pretends to be related to Janet Jackson, a black woman, partially, and they pretend to be related, and he is as white as an elbow macaroni, or a white goose. He is not a black person, though he does have some black ancestry, but he is a primarily white person, and he pretends to have bleached his skin color, which is a crock of shit. Now, I want you to kill that mother fucker, as well as Sylvestor Stallon, and Arnold Schwarznegar, Clint Eastwood, Morgan Freeman, Kirk Douglas, Matt Damon, Robert De Niro, Anthony Hopkins, Gary Busey, and their Lesbianists' buddies.

Retractions

Mr. Jerry Springer is not a Lesbianist. I was mistaken about him, as he was already killed by them, in a previous lifetime, as he developed a desire to bad mouth them, and they didn't like him, and they kicked him out of their group, and they killed him, with their murderous torture routines. Penelope Cruz is not a Lesbianist, but she was, but they killed her, and tortured her, and she is off the list. Angelica Huston is not a Lesbianist. She was, but they killed her, after torturing her. She is a popular and prominent person, and if she hasn't been abducted yet, by the Lesbianists who will feed her to my abominant kids, like they did to Steve Irwin, and Jeff Corwin, then they will be gettting around to it, not too long from now, as they like to feed her to the abominant kids of mine, just as they do Bill Gates, and lots of other, former Lesbianists. None of the Baldwin brothers are Lesbianists, either, as they were already kicked out, and killed by them, and then grievously tortured by them. They continue to be main attractions for feeding to my abominant kids. Jack Nicholson is not a Lesbianist, now, either, but he was. Ben Affleck is not a Lesbianist, as he was also kicked out of their organization, after they tortured and killed him. Charley Sheen is not one, either, but he was. Martin Sheen is not a Lesbianist, but he works for them, and he was one, before they kicked him out, after they tortured him, and killed him, in a previous lifetime. Michael Douglas is no longer a Lesbianist, either, as they killed him, after their brutal torturing of him. He is up for being abducted, and for being fed to the abominant kids of mine, as he is a prominent person, and Kirk Douglas enjoys watching him get eaten up, and Kirk Douglas will laugh his guts out, as he watches Michael Douglas get tortured by the Lesbianists, which Kirk Douglas is a confirmed member of. Cher Bonno is not a Lesbianist, as I was mistaken in memory, though she was a leader for a while with Oliver North, she was killed by them, after being tortured, because she was getting "soft". Sunny Bonno was a Lesbianist, as well, but he was also killed after being tortured, officially kicking him out of the members league of Lesbianists. Sunny Bonno was captured, and abducted, and a body double was placed on a coroner's table, and Cher Bonno knew that the body double who was dead, who looked like Sunny Bonno, was not Sunny Bonno. The Lesbianists subsequently fed Sunny Bonno, after they captured him off the ski slopes, to my abominant kids. Elizabeth Taylor was thrown out of the corp of Lesbianists, after they heinously tortured her, and murdered her, and the Lesbianists have her slated, scheduled, after they find a way to abduct her, for feeding her to my abominant kids. Dennis Miller is not a Lesbianist. Though he was one, after torturing him, and sushi-izing him, please see my notes on that, the Lesbianist's sushi-izing of Dennis Miller eventually killed him.

It's hard to keep track of some people, as to whether or not they are currently Lesbianists. Others, are not so hard to keep track of, and I want all of those mentioned, killed, immediately.

Captain Off The Bridge.

On Praying, Fucking, Sucking And So Forth

You are rewarded for praying Nam Myeo Ho Ren Ge Kyeo. You are also rewarded for fucking, sucking, tounging, licking, fingering, dicking or massaging your dick against a woman's bun bun, or inside of her butt hole, where there are lots of sensitivities buttons that get her clicking and eroteming and orgasming, or against her titties to get her eroteming and orgasming, and so on, and for palming or massaging a pelvital button, or the love and joy stick, the dick, or a love button or love patch, igniter switch, or whatever nerve sending touch sensitive love joy button there is embedded into your body, in the pelvis, groin, vagina, and in the musculatures of the groin, pelvis, and vagina, with the palm of your hand, and so on. You also get rewarded for throating a woman with your dick, as there are lots of love buttons in her mouth, and throat, lips, and so forth. Men also have love buttons in their lips, throats, tounges, mouths, butthole, and on their body, and those buttons also get clicking, and turning on and off, and sending sensitivities messages or signals, nerve pulses, up the eroteming nerval system and up the orgasming nerval system. You get rewarded for dicking men and boys in the throats, and in the buttholes, and their bodies, just as you get rewarded for dicking women. There is no discrimination in this area, and every one is equally rewarded for their meritorious acts of dicking others, women, girls, men, and boys.

Why are you rewarded for praying Nam Myo Ho Ren Ge Kyeo, and for dicking, fucking, and sucking, bumbeying, or moving your vaginal bumbey package against a woman's sexaling body parts to erotemize your self, and the woman, and for breasting your titties, i.e, rubbing your titties against or flopping them against and massaging them against a woman's butty butt or against her other sexaling body parts to get you and your friend sexually erogenized i.e., sexually stimulated, erotemized, and orgasming, and for other sexaling activities that help you and your friend and friends to produce purifying sexaling energies?

You are rewarded for your praying and for your fucking, sucking, dicking, and so forth, for helping to get every thing and every body going at the right pace in synch with every thing and every body else, for every body in my universe who is working for me, to keep them moving in harmony, perfectly meshed and in synch and in a timed persuasive mosture, with each other, so as to keep my universe standing up, strong, wholesome, robust, healthy, well, and fine. You are rewarded for praying as well as for sexaling, as you help move my children along as they do their work, as you pray and as you sexal and spray out energies from eroteming, from erotistically orgasming, and from sexually orgasmically convulsing, i.e., phlumetting, while you shatter out and spray out purifying energies in all directions, that will clearify and erase your karmic markups, and the karmic markups of others, all around you, for millions and more of miles, way out beyond where you are activiating and religialing, i.e., sexaling.

Your dicking, sucking, licking, titty massaging others, and so forth, will get wonderful and wholesome, GODLY, purifying energies shooting out of your bodies, and the energies shoot out at rates of speed that also help my universe to keep synchronized, and to move along at the right pace for it to be able to stand up and remain stable and solid, durile, strong, wholesome, pure, and a nice place to live in.

Every one who works for me, has a rate of speed they work at, a life pace, or life spin.

We all have a pace of life. In some cities, it is fast and hustling. In some places, it is slow and whimsical. My kids work according to a rate of speed that is metered, and they keeps every one moving as best as they can, according to this metered pace.

The metered synchronized pace that my children work at the rate of is one thirty seventh and one fifth, approximately, on the metronome.

If you help to push my kids along at that rate of speed, or a rate of speed that is close to it, as you pray at a metered synchronized pace and rate of speed, and as you fuck, suck, and so forth at a metered synchronized pace and rate of speed, then you are rewarded with angel dusts, or purifying energies faerie dusts that my kids daub on your head, and throw buckets loads of over your head and body and that they wash your insides out with and that they wash your body, inside and outside, with as they shower them all over you on the outside of your body, and all around in your body on the inside of you, which then help to clean you up and clearify your karmic markups, cleanse your karma, and purify your life, making you a shining, radiant, pure and holy being, though you may not notice at first, as we are too filthy, karmically speaking, to notice the changes, as our karma is too thick and mucky to allow us to feel the changes that are taking place in our karma and life.

I have a gradient scale for how close you keep people moving, and at what rate of speed you help to push them along, and as you help to push my kids along, so that they can do their work, you are rewarded, in accordance with my gradient scale, with more angel dusts or purifying energies for better preformance, and with less angel dusts for poorer or less effective performance.

You have to do some thing that will help my kids move along at a metered pace, so that they can get their work done. Praying Nam Myeo Ho Ren Ge Kyeo sets off a time frame synch. A time frame synch is the metered click, click, click, of the metronome. This time frame synch or metered pace, that you achieve while praying, Nam Myeo Ho Ren Ge Kyeo, will help keep every one moving, at the right pace, if you pray it in a rythym and at a rate of speed that will synch up with a metronome at one thirty seventh and one fifth, approximately.

Your efforts to help keep my kids working and moving at a consistent rate of speed, will get rewarded, thus for praying, Nam Myeo Ho Ren Ge Kyeo, you are rewarded, with purifying energies, that my kids dump on you.

Your efforts for fucking, sucking, licking, tounging, titty whipping or banging your titty nipple against the vagina of a woman or girl, dicking, fingering, palming, and so forth, all get rewarded, if you try to keep every thing in synch with the metered pace of the metronome at one thirty seventh and one fifth, approximately.

The gradient scale also applies, of course, as you are fucking and sucking, etc., so the better the job you do of keeping your pace at one thirty seventh and one fifth, approximately, the higher your rewards will be. Your rewards are the same, more or less, for both praying and for fucking and sucking, and my kids sprinkle and dump angel dusts, purifying energies, on you as a reward. You also get markups that are meritorious, and you are rewarded with a better and happier life.

Further, when you are orgasming, and eroteming, or pushing out energies as you orgasm, and erotem, you will be pushing out energies that shoot out at consistent rates of speed. These rates of speeds of these energies are in concordance with our pace of life, they all perfectly mesh with the paces of life that my kids keep. The energies as they pass out, and push along through time and space, at synched up and consistent rates of speeds, all help to keep my kids moving along as they do their work and tasks, and they all help to keep our universe, standing up, strong, healthy, wholesome, well, and fine.

Chaos breaks the legs off the foundation to our universe, and our universe begins to creak and moan, as it begins to crumble, slide, twist, and tumble downwardsly.

Making chaotic noises, and chaotic movements, detracts from the harmonics of our universe. Your breaking glasses, and breaking skulls, and legs, and arms, are also chaotic events producing, in most cases, and they will detract from the perfect synch up of our universe, as leg bones and arm bones, skulls, fingers and toes, begin to splinter, as you apply pressures to them, you get negative markups for your actions. A record is kept of every chaotic action you take, or make, and if you make enough chaos, in your lifetime, and in your following lifetimes, then you will suffer from your poor records of performance for keeping my universe standing up, wholesome, healthy, happy, and well.

Every scream you cause to be vocated or vocalized, is recorded, and the intensity of the scream, and yell, and crying out in pain, plus a lot of other factors involved, are all recorded by my kids, and you get negative marks for that kind of performance.

The love making oooohs, and aaaahhhs you cause to be vocated, are harmonic appeals of soothing restfullness to the spirit, and to the mind, are also graded, and you are graded on how well you can cause others to produce them, and your scores are kept, and if you are a lousy performer, with more negatives than positives, you'll end up with a lousy life, as a result, as you are rewarded in accordance for your positive performance, as well as for your negative performance.

Helping to keep all of my children working in harmony, and doing their jobs and tasks, at a metered pace, will be rewarded, not only with angel dusts, but also with a better life with more positive fortune, as you recieve positive points or merit points for your collaborating with my children, and working to support them, and more fun as your life becomes graced with more positive merits and as your rewards begin to pile up, and more good things begin to go on in your life.

If you sit on the side of your chair and have a pair of drum sticks, or are using a bongo drum, or calypso drum, with the long tube belly, or stack, a long barrel tubed drum, or if you sit at your drum set, or set up your electronic drum pads, and begin pounding away, in a syncopated manner, for your pleasure, just drumming away, with no notion in mind as to any thing other than achieving a nice rythym for you and your friends to listen to, if you happen to be with friends, your merit points will be near zero, and your efforts will not rate on my gradient scale, as your actions will not be in accordance with my program for a better universe for all people, and for my kids to live and work in.

If, however, you have the attitude, "I wish to support John's kids, and syncopate myself while I'm drumming, so as to be supportive of John's kids, to help John's kids work in a syncopated manner, doing all I can to support John's kids", then, your merit points as you drum, will go sky high, through the roof, and you'll get meritorious benefits for your efforts, or merit points, and good marks, for your efforts. It's like helping kindly old women, who are frail and in need of a helping hand and support, cross the street. If you act in a kindly and charitable manner to help support those around you, you get meritorious points for your efforts. These efforts of your's, however kindly, regrettably, though they are kindly efforts, are not the kinds of efforts that we need, my kids and me, need to keep my universe standing up, and moveing strongly. For efforts that support my kids work environment, and that lend a hand to them to help them to get their work done, your meritorious efforts marks will go through the roof, and you'll be blessed with angel dusts, i.e., purifying energies that help to clean up your karma, and erase and clearify your karmic markups, or marks that record your bad and cruel, or negative actions towards others, and towards your self. You can kill your self, and cause grief to others, as a result of your departure, to my Epcot Center, and that rates negative marks and negative points markings or markups for you.

When you try to do any thing, that will help to syncopate my children, and to make my children's working environement more syncopated, and rythmical, with your concentrated mind, and determination to make that a reality, in other words, a prayerful attitude in mind, hoping to make John's children's working environments syncopated, and rythmical, and in rythym with every one elses', i.e., all of my other kids' syncopated working environements, then with that attitude of hopefulness, or a prayerful attitude, than, you are rewarded for your efforts, and determination, and as you drum away, or pound and beat on your calypso drum, or on your metal Bahamian or Tinian, or Haitian, or Jamaican, drums, or on your dresser drawers, if your mom does not mind, as you pound away, keeping your mind set on your determination to keep all of my kids working in unison with each other, and helping them to keep in syncopated harmony, all in perfect flux, and perfectly meshed in timing, with every one else, as they work for me, then your rewards and positive points markups, will be very high, and you'll be rewarded by my children, with angel dusts that they daub on your forehead, and dump all over you, from their barrels they carry full of angel dusts, or purifying energies to clearify your markups from your karmic markup piles, kept inside of your body, kept in storage in the molecules.

Your markups are inside the molecules inside your body, but they are also out side of your body, in every molecule, nearly, going way out to the very farthest edges of my universe.

We will eventually get to all of them, and purify or clearify and erase all of your karmic markups, the notations and records that my kids keep on you, and on your activities, and eventually, we'll get them all, and your life will then be full of grace and happiness. It will be a long time before we get to all of them, as you and I and every one in my universe, have been here, and enormous length of time.

As you drum, or skip, or dance, or do areobics, in syncopation, with the attitude that you want to keep all of John's kids in step, and in synch, and in unison and harmonicly meshed and in perfect flux with each other, or perfectly meshing with each other, and every one else who works for me, whether you drum, skip, dance, or do areobics, it does not matter, if your mind is set and determined to help my kids, with your efforts, you will be rewarded for your efforts, no matter whether you skip, jump rope, dance, or areobically excercise.

As you sexalate, if you keep in your mind that you wish to keep all of John's kids in syncopated harmony, perfectly in flux, and in unison, just as when you are drumming, or skipping rope, or dancing, or playing basketball, or playing tennis, or badminton, or any sport, with your movements all timed, and in perfect syncopation, when you sexal with the right attitude to keep John's kids in synch, perfectly meshed in perfect accordance and flux, with each other, and with every one else, you will be rewarded grandurally, that is, grandly, or in a grand or very great manner.

Excercising And Activiating To Music Timed To One Thirty Seventh On The Metronome

Music timed to one thirty seventh on the metronome, and one fifth, or as close to one thirty seventh on the metronome that you can get, is okay, and it will help you to dance, play tennis, play sports, do areobic excercises, and other types of activities, at that pace that we need to keep to help keep my kids working smoothly, and you'll be graded on your performance, and on your attitude while you are dancing, or excercising, and the more intently you concentrate and use your mental energies and mental control to stay in synch, and in step, the better will your scores be, and the higher your marks, and the greater your rewards of purifying angel dusts and purifying energies that my working and unionized kids will pour and spread all about you, inside and out, and all over you.

Sexaling itself is a religious act. Yes. That's true. But, if you sexalate with this powerful prayerful attitude, or hope in mind, with your determined mind, and your concentrated mind, as you sexalate, and help others to sexalate, and help others to erotem, orgasm, phlumett, and shatter off wonderful energies from orgasming, eroteming, and phlumetting, your positive points and merit marks, and many other types of scores my kids keep on your efforts and behavior, all of them will go higher than any one can see, way out beyond the furthest galaxy that you can possibly see from your bedroom window, with your telescope. They'll go out to the futhest edges of my current univerese, and even beyond the barrier walls, holding up our universe, that my kids put in, to keep our universe standing up, stable, strong, and durile or durable and with tensile integrity.

Any action for helping my kids do their work, syncopated, and in unison, and in harmony, will be rewarded, with angel dusts, and with positive marks and score points in your records that we keep on you and every one else in my universe.

Your sexaling actions get rewarded, far more than any other activityating, as your sexaling actions are the most needed actions, to keep my universe, pure, durile, holy, sacred, free from negativities, healthy, wholesome, stable, and constantly in a state of improvementing.

Most people go around destroying things, and causing chaos. We, my kids and I, need people who are going to help improve the wonderfulness of our, my, yours, my kids, and all of my other kids, wether they work for me, or not, meaning, all of my guppies, who are like you, my relatively normal kids, as well as all of my abnormal kids, the abominants kids I've got, that go around thinking it is funny to eat people, and to pull them into their mouths, and crush them in miserable pain and agony, like my elephants abominants kids do to relatively normal human beings kids of mine.

covering her hips, pelvis, lower pelvis, pelvital ridge, crotch and groin, butt and butthole and lower back, there by exposing her butt and vagina. If you compare a vagina with a phlooched out butthole, you will see they resemble each other, slightly. There is no vaginal cleavage of course, around the butthole, but there is a slight resemblence between a phlooched out butt hole, and a vagina, or vulva, none the less.

The Vagina And Vulva Compared To The 'Nanny Gated' Butthole

What is the difference between a vagina and a vulva? They are more or less the same, but the vagina includes lots of parts, inside as well as out side. The vulva is outside, basically, only, as far as I understand and remember these things, now.

When you massage a butthole, long enough, it will begin to look like a vulva, or vaginal face. That's called the nanny gate, or on the male, the male butthole vagina, as I've spoken about it, before. On the woman, it is the female butthole vagina, a double 'immitation vagina' for the real one, as I've mentioned. Men's and women's buttholes are the same, and they both look like 'immitation vaginas' as I've also mentioned, after you phlooch out the butt hole of either the female or of the male.

Once you phlooch out the butthole of a man or of a woman, it will poof out, and expand, and the butthole entrance and cavity will become relaxed, and easy to insert your clenched fist into, to then push up your fist into the butthole cavity, and massage it, once the person has cleaned out the butt hole cavity and once it is clear and free from debris matter, or food matter, and rotting food particles, and fleshy foods, or hamburger meat and so on. Phlooching out the vaginal caivity takes a little longer, but with patience, you can phlooch it out, and then fist, in this manner. If you phlooch out the butt hole, and rectal cavity, you can fist your male friends, and your female friends, and every one, once they have cleaned out their poop hole, and made it free from rotting debris, will enjoy mutual, and reciprocal, fisting.

Fisting in this way, for sexaling, is alright. Fisting in the other way, for beating people up, is not nice, and you are given poor marks for your actions of nautyness, meaness, and cruelty towards others.

Over the long course of time, you all have been naughty at one time or another. I have many ways to fix you, and to retrain you, and to rehabilitate you, but you always go bad, and sour, again, as that is your main drive, or driving internal force in your lives.

The Importance Of Kindlyness And Teamwork

Why have all of my guppie kids all gone south, or in other words, gone down the road towards unkindlyness? Because, as I've explained, you forgot what the Love Of GOD is. My religion will help people to understand what the Love Of GOD is, and that will help keep them on the correct path of kindly actions towards others, and it will help them to understand and remember that teamwork to help my working, unionized kids to keep our universe healthy, strong, durile, standing up, stable, a safe and happy place to live, and a wonderful place to live, is very important.

Anyway, doing things that support my kids working efforts, will be rewarded, and doing things that detract from the harmony and syncopation of the metered pace of my kids who are working, and that slows them down, and that causes dischordance, will not be favorably rewarded, and you'll become a female schmuck, or a male schmuck over the length of time, as you live on in my universe. A schmuck is an unlikeable person.

Sexaling is the most important thing there is for us to do, other than feeding ourselves correctly to keep us healthy, and excercising, and leading a balanced, well regulated life, listening to your mama and to your papa.

My religion is based on sexaling, as sexaling is the most holy and pure activity we can participate in, or do by ourselves.

All the bullshit propaganda of the Lesbianists, that Jesus said this, and that Buddha said this, and that God will save you if you do this, and so forth, is pure balooney, bullshit, and made up nonsense.

I will not do any thing for any body, unless you help me and my children to make this universe, a more kindly, and a more wonderful and prosperous universe for all of us. If you do, I will have my kids, bless you with angle dusts as they daub them on your forehead, and then pour barrels of angel dusts over you, as they dump barrels full over your head and body, for your extra good work, sexaling, in syncopation, with my kids working rythyms, and in rythym with their syncopations, flux, and their phenomenal elegance.

Phenomenal Elegance

What is phenomenal elegance? It is their keeping harmony with each other as they work and keep every thing in order, in my universe for me, GOD.

You can not escape from this reality of your good actions and your bad actions being recorded, as my kids keep records on every one, and we make certain every one is rewarded for their good actions, and we make certain that every one recieves as close to what they deserve, to help balance things out, in accordance with their markups, for their bad actions. If they are bad, they will not meet nice people, and they will meet naughty people, and not so nice things may begin to happen between them. If they are good, and if they try to help my kids, as I've explained about, they will get rewarded, and they will slowly begin to break away from keeping company with bad people, and they will gradually ascend to higher rankings or status, and then they will begin to lead a better life, and they will begin to escape from meeting with bad people, and the good kids' lives will become blessed by my kids, as my kids begin to sprinkle angel dusts on the good kids, and daub the heads of the good kids with purifying energies, and then dump purifying energies all over the bodies of the good kids who listen to their mama's and papa's, and sexal with them, and as they sexal with their mama's and papa's, and sisters and brothers, relatives, neighbors, and others, the good kids help my kids keep this universe running smoothly, in harmony, in flux, perfectly meshed, and in perfect syncopation.

Mama's, papa's, sisters, brothers, relatives, neighbors, and others, all get their heads blessed with angel dusts, purifying energies, for their good actions along with the good kids, you, I hope, of course, too.

Plurlbalescent / Plurablescent Nature Of Negative Punishments And Positive Rewards

This is very important for every body to understand. I have my working, unionized kids reward the good people, and I have my working, unionized kids keep records on every action of every one of you, and I have my kids make sure the bad kids, meet with what they deserve, or some thing close to it, which may not be too nice, most of the time, and I have my kids make sure that the good kids, all meet with what they deserve, or something close to it, and that is usually always something nice. It may sometimes not be something conspicuously nice, but it is nice, usually, or positive in nature, always. The bad kids will get rewarded by something that is negative in nature, always, usually, or plurlbalescent. What does plurlbalescent mean? It means, it might not be noticably negative, but it is still negative, in nature, in essence. This is a topic we can discuss, another time, or you can ask my kids for more information on it, when you go in and visit them, with your mama's and papa's, sisters and brothers, relatives, school teachers, principal, costodians, janitors, school workers, and others.

We have had too much chaos of late, and for quite some time, and it is now time to slow it, and bring it to a halt. We are going to produce positive harmonic concordances that will assist my kids as they work, and that will help them to stay working in harmony with each other, with your fucking, sucking, eroteming, orgasming, your shooting out of purifying energies as you orgasm, and erotem, and with the increase of the oooohs, and aaaahs, you help to produce, with your practice of my religion.

We have to bring an end to the moronic violence of the Lesbianists. If that requires a lot of my children, making lots of babies, and lots of energies, and percussive forces, when you set off a fracturable rock bomb, then that is what it will take, as you blow Washington DC and the Baltimore metro area off its ocean ledge, and into the Atlantic, with that fracturable rock bomb, if it is big enough.

Yes, there will be lots of painful, ouches, and screams, and so forth, but it is trite, compared to the violence these idiots have been perpetrating, over the long span of time that they have been in my universe.

We have been here for a very long time. It is nearly impossible to figure out how long, other than with mathmatical computations. Our brains will burn out, if we try to figure it out in our heads.

It does not matter how long we have been here. It does matter what we do while we are here. You are not going any where else, and you are all staying in my universe, so you will all drop your pants, and your dresses, remove your shoes, socks, clothes, underwares, panty hosees, and panties, disrobe, and begin helping others to make lots of ooohs, and aaaahs, and lots of eroteming and orgasming energies. That will be the begining of your getting into line with the rest of us, here in my universe, my kids who work for me.

As you eroto with each other, you'll get graded on your performance, and you'll get paid by my kids, once you join our country, as I've explained about, before.

Timed Persuasive Mosture

What is a timed persuasive mosture? It is just keeping every body in synch with each other, persuasively and accurately moving along, orderly, in an ordered fashion or manner, and with every body in rythm and syncopated with each other.

Mosture is a type of motus, or motion or fluidity of movement. The timed fluidity or fluidness of my kids working along in synch with each other, is critical to having every thing in my universe, standing up and sturdy, with every thing holding together, as it should be.

Otherwise, if my kids and their work get out of synch, things can come crashing down, and things can come falling apart, and we do not want that.

This is a big universe, and we have a lot of people in it, my kids, and you wouldn't believe how many kids I have. Anyway, they all have to stay in syncopated, fluid motion, with their paces of life perfectly meshing with each other's paces of life, to accomplish their jobs and tasks, in an orderly, and in a fluid movement, harmoniously, and without delays.

The persuasiveness is accomplished with the help of your sexaling, and by your keeping pace, and synching your sexaling activities, and the movements involved in your sexaling activities, and by your spraying out your energies, as you erotem, orgasm, and phlumett.

The persuasiveness is also accomplished by your keeping pace in unison with others while you are praying the syncopated phrase, Nam Myeo Ho Ren Ge Kyeo.

Every thing is timed, and so as you activiate, or carry out these activities of sexaling, eroteming, orgasming, phlumetting, as well as the movements involved in sexaling, and as you pray, your synching of your movements and sounds in time and in pace with the syncopated and metered metronome click, click, click, at the timed pace of one thirty seventh and one fifth, on the metronome, approximately, helps to persuasively move, or persuasively drive and push, every body about, and along, as they do their work for me, in their many syncopated paces of life, or life spins.

I have many children working at different life spins, as I've mentioned before, and each group of them has a different pace of life, or time spin. Your activiating, as explained, helps drive them along, each at their own pace of life, or time spin, perfectly meshed with every other child of mine, also in his or her, and at his or her own particular time rate of speed, time spin, life spin, or, pace of life.

Every one and every thing must move along in perfect flux, or perfectly meshed with every body, and with every thing that is going on in my universe.

You are rewarded for your helping to move my kids along, in perfect flux perfectly meshing with every one and with every thing that is going on in my universe, with your efforts at sexaling, and with your praying, as explained, earlier.

In our new society, which we will create, you will score earning points, and every thing you do, as you sexal, and so forth, and as you pray, is scored, and a record of your capabilities, or excellence, or lack of excellence, is kept. You are paid according to your work performance, as you sexal, activiate, pray, erotem, orgasm, and phlumett. Also, you are graded on how well you get along with others, and on how well you try to harmonize and then sexalate with others. You score earning points, accordingly, and you get paid, according to how well you perform.

Keeping Every Thing And Everybody In Harmony And In Synch

Explaining how this works, how praying, fucking, sucking, dicking and hugging, etc., helps keep every thing in synch and in harmony and how your efforts are rewarded, is a tiny bit more complicated than my simple explanation, but that is it in a peanut shell.

Now. For those Lesbianists hiding among you who do not wish to surrender, you Lesbianists will find we are not going to be acting kindly towards you.

All of you Lesbianists, where ever you are in Washington DC, or hiding underground, or in Paris, or in Rome, Peking, and so forth, you will be dealt with harshly, as we need to put a stop to your activities, and a "maybe" is not acceptable in this case.

We are not going to allow you to continue your chaotic, nonsensical, violent activities one moment longer, and we will blow you up flying high up into the sky, and off the ocean ledge down below you, in Washington DC, as we sink your Washington DC area into the ocean, along with all of Northern Virginia, and the ocean coastal area of Maryland and Baltimore, along with large parts of the states of Virginia and Maryland, out to West Virginia, as that area settles down into and below the waves of the Atlantic Ocean, after we bomb it with one or more of my fracturable rocks weapons for mass removal of Lesbianists from the face of the earth and from their hiding places under the surface of the earth.

The Lesbianists in the Washington metro area and hiding under it, had all better surrender to my kids, or they will all get their pants and clothes blown off and shredded from their bodies, if they do not, as they are given a free ride out and up into the upper atmospheres of our planet, and then, beyond. All other Lesbianists had better surrender, too, or they risk getting a free ride out, as well.

Deep Sea Ocean Trench Off The East Coast Of The United States

There is a trench that extends south wards from Washington DC, some times reaching 25 miles out in some places, and in other places, it reaches out to eight hundred miles from the shore. In the north, it reaches out in some places, 85 miles out to one hundred and twenty five miles out, to three hundred and fifty five miles out, to eight hundred miles out in some places, in the south.

It is fifteen miles deep when you go out forty five miles off the coast from Washington DC and from the Chesapeak Bay. The ledge bottom is found about three and one half miles down, and the mouth of the opening continues for ten miles, approximately, downwardsly, on the western side of the trench.

The It has a gaping mouth, and it opens up and lets ocean water inland, under the continent, eighty five miles down below Washinton DC, three to six to eight miles wide, from top to bottom, from the underside of the top of the mouth, the bottom of the ledge, to the bottom of the mouth.

>From under the nation's capital, to the south, it travels to over eight hundred and eighty five miles. To the north, it travels three hundred and thirty five miles, to six hundred and fifty miles, to about nine hundred and fifty nine miles, inland under the continent, depending on where you wish to locate the edge of it under the continent, northwardsly.

It travels to the west, inland, three hundred and thirty five miles, to just over eight hundred miles, depending on where you find the edge of it. It travels inland further westardsly, the further you travel north. It is slightly over one thousand and eight hundred miles from north to south, in total, as you'll discover, once you explode enough, and after you explode large enough fracturable rock bombs, over Northern Virginia, Maryland, Washington DC, Baltimore, covering the metro area vicinity.

The U.S. Navy, and the U.S. Coastguard know about the trench, or parts of it. They are not allowed to discuss it with anyone. No one is allowed out there, to research it as it is off limits to just about every one. Some navy personel of high rank, and coast guard personel of high rank, are allowed out to take soundings, every now and then, with their Lesbianists' staff members, and Lesbianists' personel in the Navy, and in the Coast Guard.

The Soviets, at least, Boris Yeltzin, Vladmir Putin, Mikhael Gorbachev, and Zelda Gorbachev, know about it, and so do all the other Lesbianists. They can confirm it, if they wish to play ball with me, and if they wish to save their asses, after they decide to surrender to my children.

The Shelfs Systems And Trenches Systems

The shelf estends to under Lexington Kentucky, at about ten miles below it. It is five miles up under Chatanooga Kentucky. It is five miles below Washington D.C., in some areas. It is three miles below Baltimore Maryland, in some parts of the city. It is eight miles up below Pittsburg, Pennsylvania. It is fifty five miles up below, or under, West Chesterfield, New York. It comes up to eighteen to thirty miles below McLean Virgina. It is eighty eight miles below Norfolk, and the mouth, downwardsly, is five to ten to fifteen miles wide open, in a downwardsly direction.

It some areas, it can be found below Ohio, and under Indiana. It crosses under the West of Kentucky, and into the south of Illinoise, five to ten, to thirty miles. It is a variegated trench system.

It extends to Tennissee, parts of North Carolina, Mississippi, Alabama, Georgia, South Carolina, and to under parts of Northern and Western Florida, and is open out and into the Gulf of Mexico.

The whole area of Eastern U.S.A., is sitting on an open shelf, trench system, and there is water passing below it, and out into the gulf, in several areas, over to eighty five miles west of Corpus Cristi, Glen Garden, population eight hundred and fifty, which south of Galveston, and north of Corpus Cristi, between the two cities. There is a mouth eigty five miles south of Tampa Bay, Florida, in the Gulf of Mexico. There are several openings or mouths to the underground fault line system, and deep sea ocean trench system, and shelfs systems, and water is passing from the Atlantic to the Gulf of Mexico.

There is also a trench system in the north, under Niagra, that extends southwards, several hundred miles, and it has many branches to it, and it extends into this system of shelfs, trenches, and under continental water flows.

Side Bender Currents

What is a side bender? It is a current comeing out of the mouth of an opening, from under a continental shelf system, that allows waters to flow out. As the water flows out of the mouth, the outlet current of water, it flows very forcefully in an outwardsly direction, and it pushes the water out with great force, generally. If a submarine is traveling in the vicinity of a side bender, the submarine may get hit broadside, and that will often turn the submarine topsy turvy, and around facing the opposite direction it was traveling in, or another direction, not the one it was traveling in, most often. The crew will get swung about inside the submarine, and they will fly through the cabin, and pounce off the floor to the ceiling, and hit the ceiling, and then hit the sides of the corridor they were walking along in, and finally end up on the floor when the submarine rights itself, with its balast, and you'll get many sprained or stretched ligaments, and broken bones, arms, wrists, fingers, legs, knees, ankles, feet, toes, necks, backs, hips, spinal injuries, and other injuries.

It can leave a crew of a submarine nearly one hundred percent, injured and in a ship's hospital, or a Navy or military hospital for recovery. Side benders are often called upwellings of currents by the Navy, but that is not generally the case as they are not upwellings, but they are side pushing currents, that come flowing out from under continental water flow openings, horizontally.

There may be some upwards lift involved, if there is a reason, such as a mouth is angled at a slight sloping angle, as it releases the flowing waters out from its tube like cavity or hole.

Crew members and military passengers of Naval submarine vessels are generally told not to talk or discuss any thing about side benders with non Navy persons, and with persons unrelated to their ship or unrelated to their ships voyage, as the governments of the world, do not want any one to find out about side benders, and they do not want people, geologists, marine geologists, undersea deep sea ocean studies researchers, or others, to research and investigate side benders. It's a big secret, these side benders, and that's what the marines, and the navy personel are sworn to keep, or face a fireing squad, on insubordination, or on some trumped up charge of spreading naval secrets, acting as a foreign spy and receiving money, or something like that.

Naval personel will generally obey orders, and not discuss side benders, or other 'secret' information, with any one, as they risk losing their job, and they might face a fireing squad, or a hanging patrol, sometimes called a marching platoon, or a hanging platoon, a group of soldiers commissioned to carry out orders to hang some one who is in the military.

If you pay a naval officer or enlisted person, or other person with Naval submarine duty, such as some marines, and others, enough money, they may be willing to share some information on side benders, and information about what they know about side benders. Some persons who have had Naval submarine duty, may genuinely not know any thing, such as crew members who are never assigned to submarines that travel near side benders, on a regular basis.

Some times family members of enlisted persons and of Naval officers, are allowed to travel on submarines, for fun and excitement, as a special reward for their papa's or mama's duty on a submarine. Some of these family members have also had some experience with side benders, such as those who have traveled on submarines along the Marianna's trench, or other trenches, not listed, neccessarily on global maps, but none the less, which are there, and that are near shelfs systems under sunken continental shelfs, or under sunken continents, but that eject streams of water, nonetheless.

Our maps and globes of the world are incorrect, the ones we buy through bookstores, or from map publishers, as nothing that would indicate sunken continents, large sunken islands, and related trenches, or other related features, are not going to be indicated on them.

The Lesbianists do not want you to find out information that could provoke you into researching, under water features, that they do not want you to know about, as your fictious understanding they have taught you, of the surface of this planet, and its history, is bogus, and any thing that would conflict with that, is certainly not going to be indicated on a map they would publish, and the map will be wiped clean of all traces of any thing that conflicts with the 'global' history of the earth, as the Lesbianists teach it, in geology courses for high school students, and below, and above.

The global geological history they teach must coincide with their fictious propaganda about Adam and Eve, and "Lucy" the ape woman, the supposed mother of all people living on this planet, and about this earth being only 9 billion years old, or thereabouts, which is a bold faced lie, and other such bullshit notions they have fed every one to swallow, and have forced them to accept, and that they force people to use as primal notions to base scientific research on.

The geology of our planet is much more complex than the Lesbianists are letting on to, and there is much to learn about planetary geology, as these planets have been around a very long time, and many things have happened, over and over again to them, and many things have happened to our 'solar systems', and star formations, and star systems, that people need to know more about, to get a realisitic understanding of our universe, its history, and its many complexities.

In time, we will learn much more about all these things, and you can attend courses that my children have set up for every one, to teach people about our universe. You need a day pass to visit, as I've explained about, before, and then you should swear in, and become a citizen of our country. We have yet to declare this planet ours, but in time, we will, once we have finished and put an end to the problems associated with the Lesbianists, all of their shenanigans, and their malarkying around. One day we will declare this planet ours, and my kids will take charge of everything, and they will appoint people to posts of duty, and to positions of responsibilities.

Making A Large Swimming Pool

People should begin moving off and out of the area, around the Nation's capital, Virginia, Maryland, Pennsylvania, West Virginia, and North Carolina. We'll have a big swimming pool there, with lots of, mostly uninhabited, tiny islets, or hill tops and mountain tops, after all of the current residents die, and pass on and transel over to my Epcot Center, after one of our compatriots, or groups of them, detonate enough of my fracturable rock bombs. People will have to watch out for hungry sharks, after they swim inland, above the sunken landscape, looking for corpses to eat, and to scavenge, as lots of Lesbianists' corpses will come floating up from underground hangouts and cities of the Lesbianists, under those parts of the U.S., and from under the Gulf of Mexico, from under the sea floors of the Atlantic, from under the Niagra trench systems, and from under other trench systems in the Eastern U.S. This is not a joke, by the way.

Stagnasis

Salts kiddies in stagnasis is when they are in the salts kiddies are in their salts crystals cages, in a hibernative state, in perfect equilibrium, to keep them alive and well, for as long as possible.

Black Powder 'String' Fuses

Take a spool of sewing thread, and use Elmer's glue to coat the string, and run the string with a thin layer of Elmer's glue coated on it, through a bucket of black powder gun powder, which you can order in the mail, over the internet, or pick up at an antique musket or old style 'cap and ball' musket rifles and pistols retail stores.

Elmer's glue and gunpowder will combine to form a minor plastiques explosive, after the salts kiddies mix it up, eat each other up, pee and poop out lots of stuff that is highly explosive, as they get busy making babies, except when gunpowder is used in large quantities with Elmer's glue, to form a major plastiques explosive. Benzine will help this along, with diesel fuels, as well, and with chlorine, we can see some major plastiques explosives in the making, as mama's and papa's begin making lots of children, as they begin mixing it up, and as they all begin pooping and peeing out body fluids that is food for others, that will contribute to the powerfulness and explosiveness of the mixture.

After you make your string fuse, and let it dry out for a couple of weeks, then coat a rag or muslim cloth in oil, or grease, or a mixture of turpentine, gasoline, diesel fuel, and grease, with benzine, and make a paste, and use that paste to coat a thin cloth, such as a muslim cloth, and then let that set and dry for a few days, and then wrap a few sets of 'string fuses' together in a bundle, and place them inside the cloth. It will become a very powerful explosive, in itself, the more gun powder you use with it.

Test it, to see how fast it burns once it is wrapped in a cloth coated with a mixture of grease and fuels.

The thicker the grease, the slower it will burn. The thinner the grease mixture, by adding more turpentine, or benzine, or paint thinner, the more rapidly the fuse will burn.

You will have a very powerful explosives cocktail, with this mixture, so be careful.

You have to be very careful with what you combine, as you'll be bringing together very explosive elements, when you mix these fuels and liquids together with gun powder on a string.

A few string fuses, wrapped in a well soaked cloth, with a mixture of these liquids and the axel grease, will make a type of plastique explosive, that can be used as a shape charge, or a mouldable, or shapeable, explosive, that is good for blowing doors off hinges, such as at pharmacies, or banks, and for blowing locks on private homes' fences to pieces, such as can be found at the White House, at 1600 Pennsylvania Ave. Washington, D.C., at the entrances and exits gates of the White House where guards are on constant duty patroling the area for security purposes. An initial explosive, a detonated fracturable rocks bomb, small in size, may cause a concusive force to cause the guards to black out, and pass out, and then sleep for a while. Be very careful with the size of the bomb, as we do not want to level the homes and buildings surrounding the White House, or across from it in Layfayette Park. After you put them to sleep, with your initial blast, you can test the shape charge on the nearby fences, at the White House.

Black Powder 'Cap And Ball' Pistols

Most black powder cap and ball pistols and rifles, muskets, sellers and retail outlets can be found on the internet, and some gun shops carry black powder, as well as the detonating fireing caps, for black powder rifles, and pistols.

Many of them do, and you can purchase the black powder and copper detonating, ignition caps, for useing in your cap and ball pistol, or musket, or other, more modern, hunting rifle, that allows you to use black powder, and detonating copper caps that slip on a small round fireing ignition nipple that is made out of steel, and has a hole in it, to allow the percussive explosives in the firing copper igniting cap to ignite on impact with the hammer on the weapon, when it slams down on it, and the flames from the igniting explosives mixture, glued to the inside of the firing copper cap, then ignite the black powder, that was rammed down the barrel, or packed and tamped down in a cylinder of a percusive black powder cap and ball pistol.

The caps are fairly useless, unless you wish to add them to a fuel oils, chlorine formula, and let them sit in the fuel oils mixture, and that will help develop plastique, as well.

Higher Temperatures Develop More Useful Energies For Making Babies

The copper in the cap will also allow for a higher temperature in burning, when the fuels mixture ferments after a few weeks. Magnesium in the cap as well, will also help to raise the burning temperature of the fuels mixture, and with some black powder added, and with some chlorine added, your plastiques recipe will become even more useful. These higher temperatures will help to produce energies that will be conducive to baby making among the fracturable, or rupturable, and percussive, rocks radiological salts kiddies.

You can then add a handful or more of powderized amethysts, or turquoise, that you can purchase in bulk, on Ebay, for some small bulk quantities, and also emeralds are useful, as they all have fracturable rocks kiddies embedded in them, and fast asleep, in stagnasis.

Zircon Diamonds, And Other "Radio Active" Gem Stones, Etc.

Zirconium is a mineral that they use for the fake diamonds they sell with the trade name, Zircon diamonds, or Zirconium diamonds. You can powderize them, and use them for a good amount of fracturable rocks explosives, large and fast family making, salts kiddies, for a 'nuclear' party, and a send off to the eastern coast of the United States, before it is blown off the coastal ledge it sits upon, and then sinks below the ocean waves, if you strike it hard enough, with one or more of my fracturable rocks babies making, "nuclear" salts kiddies bombs.

You'll need a few handfuls of Zicon diamonds, powderized, to make a nice fracturable rocks, babies making bomb.

You can mix turquoise, emeralds that are mined and sold in bulk quantities on Ebay, amethyst, and the other rocks that I've mentioned, along with powderized 'sand' from the beach. Argentina, and Venezuela, Baha, and Southern California are good places to collect useful sands, full of fracturable rocks, salts kiddies, that a geiger counter will detect, if it is a sensitive enough geiger counter.

Geiger Counters And Their Usefulness

They are not too hard to build, but you will have to look in your Popular Mechanics magazines, for the details on how to build a "geiger counter". Some mining stores, and mining outfitters stores, may be a useful places to order or purchase a geiger counter, if you are on a family budget. You might find one on the cheap, on Ebay, that is still useable.

There are some kits available, if you look hard enough, to use to build your own geiger counter. A mining outfitters store, in South America, or in Central America, or in Utah, or in Nevada, may be able to help you locate a kit, to put together, if you go in there, and pretend you want to go out and look for interesting rocks, and you need some information on where to look for interesting rocks, so go to a mining outfitters store, or to a rock hounding club, or rock hounding retail store, for looking at beautiful stones that rock collectors, or rock hounds, have found, and made available at the store. Usually the store owner will have his or her suppliers, on name cards, and you can get in touch with them to get more information on where to look for interesting rocks to test with your geiger counter, since you are facinated by radioactive elements in rocks, and you are interested in finding some, for a collection you wish to start.

You might want to pick up some primer books, on minerals and rocks, gems, and gemstones, from Amazon online, or from a local book store, such as Barnes and Nobel book store, which has a few useful books on rocks, mineral rocks, gems, and gemstones, that you can find when you are out rock hounding.

Desert Outfitters in Las Vegas, a miner's outfitters store, that also provides useful tools to rock collectors, such as rock hammers, and hand held pick hammers, for chipping away at rocks, to see what is under the surface of the rock, or under the peel of it, the outer layer, as well as terrain maps, and outfitting supplies, tents, and sleeping bags, and so forth, has these types of books, and lots of maps, and maybe they can help you find useful kits to purchase, to build yourself a geiger counter. They also sell geiger counters for about three hundred and fifty dollars or so.

Sears used to sell Geiger Counters, and they still can order them for you, I think, through their catalogs. On Ebay, you can find many reasonably priced Geiger Counters. How well the geiger counters work, the ones people sell on Ebay, I can't say, so you'll have to talk with sellers, and see what they say about the geiger counters they are selling to others on Ebay, or read about them in old copies of popular mechanics, and in trade publications for the mining industry.

Novice And Amateur 'Rock Hounding' Rock Collectors Clubs

On Sahara, east of Las Vegas Boulevard, there is a rock shop, which is about two and one half, or so, blocks down from the intersection, on the north side of the street, and they have information, as well as lots of primer books, on rocks, and on geiger counters, and where you can find them. They are well connected to the local rock and gem, minerals and gems finding, or rock hounding clubs. You can meet their members, and go out with them, on excursions, as they know where to find just about anything.

There are similar clubs in every major city, and in lots of smaller cities. Mining towns of course have lots of mining outfitters stores, and they probably have geiger counters for sale, so you can use it to find some very nice, fracturable rocks, along coastlines, or in ancient dry lakes and seas, sediments filled, rock hounding areas.

Decontaminating Your Self With Ocean Salts

Acidic ocean salts in ocean water will help eat up the radiological kiddies that find their way into your bodies, and that make you feel ill. It might take several weeks for initial recovery, with you taking large amounts, several teaspoons or more, as much as you can handle, in your diet, every day, for up to three to eight years, to thirteen years, for severe contamination, and for full recovery.

Other things, such as nutmeg, and oregano, in a salty tea brew, will also help you, and marijuana in the salty tea brew, will further help you. Berries can also be of great benefit for recovery from radiological salts kiddies contamination.

My kids have a recovery kit, that will help you recover from an overdose of radiological salts kiddies, after a major birthing event, and that kit will help you fully recover. You need to join our country, and swear in, and become a citizen, to be given one of these kits to help you for your recovery. They can provide you with information, of various kinds, once you swear in. They have you swear in as full time citizens, now, except in special cases.

Ancient Dry Lakes

There are many ancient dry lakes, up north, in the colder areas, of Manitoba, and around the edges of wet lakes, you'll find areas that dried out, a long time ago, and you'll find interesting things in the sediments deposits under the surface soils of the earth, that have covered most areas, and that come in to our atmosphere, and then deposit themselves onto the surface of our planet, as they are blown in on the solar winds. A few feet of top soil may cover the dry lake areas, around the edges of these lakes, and the soils depths may reach to twelve feet, to fifty feet, to sixty or to eighty of more feet, in some areas.

Once you hit the sediments layers, around the edges of these lakes, outwards to eight to fifteen miles, to thirty miles or further, out to up to eight hundred miles, as in the case of Lake Erie, and that lakes region, the Great Lakes, that all use to be one large salt water sea, but is now, a fresh water set of lakes, you can begin looking for the radiological bullets of the previous catastrophes in my universe, that shot out radiological salts kiddies, into the sediments rocks of mineral stones, and sand. Gravels might contain some "radioactive" fracturable rocks, and you can tell which are the useful ones, with a geiger counter.

There are still salt water lakes up in Manitoba, Lake Huron, and some others, that used to be part of Lake Erie, and all part of the Great Lakes, when they were a large, salt water sea, but which are now, no longer part of that lake region system of lakes, as fresh water now fills up the Great Lakes from under ground water systems of fresh water flows.

Hydrolific Pressures From Water Falls

Hydrolific pressures, from water falls, primarily, help to erode and carve out and build the under continent open areas of water flows, that flow under the continents, and that dump their waters by traveling underground, in culvers, and channels, and in trenches systems, and then flowing out and into the oceans, resulting in side benders currents and flows.

Underground Lakes

Hydraulisis is one type of water pressures. Hydrolific pressures are those pressures created by water beating down, steadily, as water falls from higher to lower places, creating underground holes, and large open underground cavities, and water holding vessels, aquafirs, and underground lakes in the underground rock layers. Lots of cities sit on top of such underground lakes, on the crust of the surface of the earth, or very near to them. The lakes are often ovular and rounded in shape, from top to bottom.

Many former water falls, are now low lying, and flat, and there is no water fall on the river, except for minor, cascades, such as found in the Grand Canyon Rift Valley down the Colorado River, and out into the Baha area.

Baha Mexico

Baha is a good place to go looking for interesting, "radio active", or radiological rocks, fracturable rocks with radiological salts kiddies sleeping soundly, embedded into other rocks, after colliding with them, in a hail of radiological rocks bullets, after a planet or a galaxy, or a large nebular star system, or a cluster of them, were detonated, by some fool with a huge and powerful, home made bomb. This happened, often, in the past, and still, today, it happens, now and then.

Bits and pieces of the radiological rocks will come flying in, and then embed themselves into other rocks, as I've explained about, before. We've had so many catastrophes in my universe, that our ancient rocks, are peppered with radiological rocks that are embedded in them.

Off the coast of Baha, is a good place to go diving, looking for rocks that were washed off shore, as waters flowed down the Colorado River, trinities of aeons ago, when this planet was still a young planet, maybe about one fifth the way through its infancy, after reforming, again, after its last major impact that shattered it to pieces, for the umpteenth kazillionth, plus more, time. This shattering and reforming, has been going on too long to count, and obviously, there is a large amount of mixturing going on, with debris from other star systems, galaxies, nebulas, and so forth, floating in, and becomeing part of our planets, all around and about, on solar winds.

You'll find rocks on the inside of the Baha coast, and on the outside, as well, and along the Baha coasts. You might have to dig down thirty of fifty feet, to a few hundred feet to find them, maybe eight hundred feet, or sixteen hundred feet, or further, but you'll eventually find something useful with lots of radological bullets embedded in the rocks.

Finding Good Rocks

You can find interesting rocks, also on high hilltops, such as in the Andes, the Himilaya's, the Swiss Alps, high mountains in Austria, and in Germany, high hill tops and mountains in Iran, maybe in Afganistan, and the very high hill tops, that are generally old hills, in many countries. They will usually have, if they are very old hill tops, lots of rocks scattered about that are very old, and that have lots of fracturable 'radiological' salts kiddies, and other related kiddies in them, as well.

Sledgehammering Continents And Land Areas Where Lesbianists Live, Hiding Below

Here are a few places to place some other fracturable rocks bombs on, to make them fall in, and collapse down onto the layers of rocks, below, and then puncture the ceilings of the cavernous cities the Lesbianists have made, down below those lower rocks layers.

Topango in the South Pacific near the Marianas, the area midway between the Ryukyu Islands and Haha Jima, Chichi Jima, and Iwo Jima, where you will find a sunken continent, Wellington New Zealand, Peking, Falklands, Urals Mountains, Chile thirty miles north of Concepcion and eighty miles east of it, near the Argentina border, and the Kamchatka pennisula, which will split and collapse in the center of it, midway down the penninsula, if you hit it hard enough. Lesbianists will come floating up, if their bodies can fit between the tons of debris that will fall in on them, as you smash the land sites that sit on top of ocean shelfs, and on open lakes below the land, some miles down from the surface, in some cases, and further down, in other cases.

It may be hard or impossible to deliver a nice bomb below the ocean above or onto the top of the sunken continent below the ocean, between the Ryukyu Islands, or Okinawa, and the islands of Japan, called, Chichi Jima, Haha Jima, and Iwo Jima. If one can be delivered there, you'll crush the continent below the surface of the ocean, and that will cave in on the cities, there are more than one there, that are below the protected shelf layer of rocks, above the cities the Lesbianists have there, below the sunken continent, to live comfortably in. The other places aren't so hard to hit. It is just a matter of local interest, and urging of the people there, to take the correct action to help us to resolve this problem, of Lesbianists living below us, all around the globe, in their honey comb, bee hive like canival of cities.

A canival of cities, is a large collection of cities that is located in such a way as to make it easy to get from one place to another. They are conveneint for them to live in as they are well placed, and spread out evenly, using the full extent of the area, as efficiently as possible. The Lesbianists have a canival of cities under the lower rock shelf layers, that are above them, and that help to keep them protected, warm, dry for the most part, but not always, and that are conveniently located each one in a bee hive like, configuration, well placed, with a well designed, layout, with central cities, and with satelite cities. It is well designed and resembles in part, Melbourne Australia, which was laid out, planned and designed as a modern city. The Lesbianists of course, think Melbourne is puny compared to their accomplishments, and of course, with the technologies they had and have available to them, from time to time, they made good use of every inch of space they have available to them, under the lower hard rock, but leaky rock layers above them.

My kids have places and locations maps of all the best places to locate your home built fracturable rock bombs, and so please pick up the information from them, after you have sworn in, as citizens of our country. Also, please see my earlier notes on the sciences that support a correct understanding of radiological particals based fracturable rocks explosives and other helpful and useful explosives you'll need to set off the fracturable, also called, rupturable rocks bombs, i.e., the so called 'nuclear' detonations.

Topsoils

Did you know that nearly 99.9999+ percent of the earth's crust, or mantle, is formed from space debris that has floated in on the solar winds? It's true. Only about 0.000001 percent of the top soil is from local vegetation, globally speaking. The rest of the top soil comes in from above, blown in on the solar winds, as debris from other planets that have been destroyed, crushed, or blown to pieces by idiots with very large bombs, that demolished whole galaxies, or multiples of galaxies, in a few milliseconds, as the instant they blew up, they were so well made, or constructed, and so powerful, they instantly blew up the whole area of galaxies the planet was located amongst.

If for instance, you fill up one third of the large tourist attraction, the meteor crater in Arizona, with one of these fuels and rocks bombs, and ignite it, you'll disentegrate all of the Milky Way, and some what more than that, in one attempt, by my estimation, if the fracturable rocks bombs were made well enough with the fuels bombs, to burn at near or close to, solar temperatures, and if there were enough materials in the fracturable rocks, to get lots of mama's and papa's making lots of babies, relatives, and others. There are lots of different types of salts kiddies in fracturable rocks, and there are other types of kiddies, the radiological kiddies, which are sometimes, but maybe are not always, grouped with the fracturable rocks kiddies. There are many types of kiddies living in radiological rocks. When we send high heats waves energies, and other types of energies into the fracturable rocks, we can get many types of kiddies to begin making babies. If we get enough of the different types of kiddies to begin making babies, we will have one fine and dandy, explosive shower of baby making events. You can get further information on this topic from my kids, and if you tell your friends to check in with my kids, and to swear in, and become citizens of my and my kids' new country, along with other people who are swearing in, and becomeing citizens of our new country, my kids will make certain that every one is protected, and no one is caught outside, when the bombs go off, as my kids will tractor you and all the other citizens in, with my kids advanced teletransportation technologies, before any one can get hurt by the bomb or bombs blowing up, locally, or in their areas. That means, my worker unionized kids are very quick on getting people into the encapsulated living environment every one is living in, below the ground, that my kids built for every one to live in, until we get this problem straightened out, and until it is safely over with. People can continue to live in the encapsulated living environment, after it is over, as we are going to start a new economic and social system, and we are getting started, down below, where my kids are keeping the encapsulated living environment, well taken care of and well managed.

Later on, we'll worry about who comes out, and when, as we have plans for every one, to begin working inside the encapsulated living environment, which is very well designed, and bomb proof, of course. Once every one gets accustomed to the new way of living, in accordance with my religious principals, and in accordance with our new working and living programs, when people have saved up enough money, they can pool their money, and acquire a lease for land up above, on the surface, and then with more money, they can have nice places designed for them, and built for them, with your input and with your instructions. You will need to study designing homes, and layouts of homes, for large numbers of people, as you will be required to live in groups of people, as the old systems of living, one husband, one wife, and so forth, is out the window, and now we are going for group living, with many members to your groups. When you have got the maturity together to live in large groups, and to sexal with many people in large groups, then you will qualify, and then with lots of earned income, pooled together, you and the members in your group, can then move up and live on the surface, in your well designed home, which my kids will use their technologies to build for you.

This is how we are going to clean up our planet, and get started with a whole new system for living and working with each other, as GOD's children working and living together, begining here, and spreading, slowly, across and throughout my universe, as we bring others into our program, all across the universe, from end to end, from top to bottom, and from side to side, and in every nook and cranny of my universe.

All of my kids, you, who I am speaking to, will learn to live and work together, supporting my worker unionized kids, in our new global, united, and universal society, we will begin to build, on this planet, first, and then later, every where else.

I am the mother and father of all of you, and of all of my worker, unionized kids, as well, all of my kids who work for me, of course, and of all of my living beings, and of all of my animals. We are going to get this big family of ours, together, and we, the human beings, will begin to clean up our universe, by sexaling for a living, and with many other living by the points systems programs, and other projects. We will also begin to get our heads on straight with religious activitiating, in other words, by participating in religialing, in groups, or by oneself, in the encapsulated living environment, first.

As we move along, in time, we will develop our working strengths, and character, and some people will qualify, eventually, for working in my religious brigade, once they realize and understand who I am, i.e., GOD. Others, who do not give a darn about what I am doing, may do as they like, as long as they are citizens of our country, and as long as they enjoy what they are doing, and as long as they add to the welfare of all people in our society, universal wide, as we build it, larger and larger, for all of my children, no matter who they are. We will one day have all of my children, working for me, and if they do not like working for me, they still have to pay the fees for the resources they use, just as I have to, and that means, there is a charge for every thing we use, and it is detucted from our pay checks. Every one gets a pay check, if they work, and if they are disabled, they will get earnings to support them, for as long as they need to be supported, until they are regroverated, healthy, fit, mentally prepared, and willing and able to participate. Those who do not wish to participate, will work in jail cells, and prison cells, sexaling for a living, with animals, as I've mentioned before, and at carnival and entertainment centers and districts, we will eventually set up, first on and also inside of this planet, in 'encapsulated' carnival and entertainment parks, and later on and within, other planets.

We are going to have all my children working for me, eventually, as I've spoken about before, and in time, most people will wish to work, and when they are mentally prepared to work, they will enjoy their working, most likely, as sexaling for a living, is not a unwholesome way to earn a living, and it is a pure and holy way to earn a living, and a pure and holy way to spend our time, as part of our new working ethics environement. For more information on this, please see my worker, unionized kids, who handle the information hot lines, in our, and your, and their, as well, encapsulated, living environement, which they have built, maintain, and manage, for all of you, and which they are continuing to build and expand on, for the rest of you, who have not checked in with them, yet.

My worker, unionized kids have their own places to live, inside of the molecules that are used in building your living environment, and in your bodies, and in the molecules outside your living environement, as well. They live in all of the molecules, all over my universe, and they work in them, as well. They have their own universes, that they live in, which are all contained with in the molecules in my universe. It is a little more complicated than that, and so see them for more information on it, if you are interested in learning more.

Disintegrating The Milky Way

The Milky Way is made up of not one galaxy, but of several thousand, of different sizes. We don't have the technologies to see too clearly to distinguish the different galaxies that are within the borders of the Milky Way, nebular star system and nebular star cluster system, another way of saying that the Milky Way is a collection of many nebular star systems. Nebular star systems can be considered similar to galaxies, but maybe not always, as there are exceptions to every thing in most cases, any way.

We are of course part of the Milky Way, I suppose you could say that, but we are far out on the outer fringes of it, and we are not any where near the center of it, and we have our own galaxy we are a part of, and it is not part of the Milky Way, so technically, we are not part of the Milky Way, although we might like to think we are, since it is an expansive set of star systems, and star clusters, nebular systems, and other types of solar bodies systems, and it covers over us, and beyond us, sort of over layering us.

Be that as it may, we do not want to blow up or disintegrate the Milky Way, as we are in a way, part of it, or at least, we are encovered by it. Encover means to be covered over by something and encased within it, or to be encircled or surrounded by it.

Retraction

Tom Selleck is not a Lesbianist but he was a Lesbianist, until the Lesbianists killed him, after expelling him from their group, and after torturing him with their many heinous torture methods.

Captain Off The Bridge.

Lay Order Of People

I have no lay order of worshippers, who participate with me, in any thing, or in any way. Why? Because, that's like me, the captain of the ship, coming into a town of persons who I don't know, and then saying that I'm the authority over them. No one is going to listen to me, and no one should be expected to listen to me. I wouldn't attempt any such thing, and so as the captain of my ship, my religious order, I have no authority over lay persons.

I have nothing to do with lay persons, what so ever. I will never have any thing to do with lay persons, unless they realize that I am GOD, and that I am the mother and father of all human beings, and all animals, and all living beings.

No one is going to recognize me as GOD, for a long time, as no one has the karma to recognize and understand that I am GOD.

Lay persons are free to do as they like, and I have no regulations concerning them, in my religious order. My children may have many regulations, for non religious order people, but I don't have any thing to do with that.

Donations For The Sake Of My Ministry

The only thing is, that, as I said before, if a person recognizes and understands that I am GOD, and that I am the Mother and Father of all human beings, all animals, and all living beings, then they are free to donate cookies to me, or clothes, or wearables, socks, and scarfs, or coats, sweaters, or slacks, neckties, and so forth, cakes, or cupcakes, baked items, or financial contributions, or chairs, and furniture, beds, linens, tables, office furniture, phones, phone lines wiring, electrical wiring, plumbing items, housing items, for building up a house, paved drive ways, mason or rock walls, surrounding the property, or a set of dormitories, or a prayer sexaling room, or a prayer ceremonialing room, or a swimming pool, sauna, bath house, toilet facilities, bathing facilities, laundering facilities, a root cellar, a molds and funguses workshop, a brewery workshop, or any workshop for helping to educate others, the land to build these things on, or money, or whatever.

If they recognize and understand that I am GOD, that is perfectly alright, to donate any types of items, or any thing of value, that would assist my ministry to get up and get running.

As yet, no one has recognized me as GOD, and no one understands that I am GOD, and the mother and father of all human beings, all animals, and all living beings, so as yet, I have not heard from one person, not a letter, or a phone call, other than an occasional wise cracker, mischief maker, or a person or person who are worried, and then complain to me, or rather, to my answering machine, most often, as I don't pick up the phone, now, as I had one person calling who was a bad kid of mine, and he was just looking for trouble, and since that, I just ignore all complaints, or wise crackers, or mischief makers, and so on.

Nollicking Foolish People

Some people do not like me wearing my GOd cap, that is one of those specialty base ball caps, but with 'GOd' written across the front of it, and they might hate me, especially some South American or Central American Hispanic types, who have primitive and backwards religions and filled with local lore and ancient tales of demons, and goblins, and gooney bears, or ghostly ghouls, or other superstitious ideas and notions of things that go 'boo!' in the night, and try to scare or hurt people, as there are plenty of folklorish tales of such things, in primitive cultures, that thrive, even at the current time, nowadays, in large cities, even, and these types of people might want to kill me, and when they knock on my door, with their gun in their pocket, or in their hand, machete or knife behind their back, I just ignore them, and I don't even bother to get up from my work bench, i.e., my bed, to see who is knocking at the door, as I know already, they have nothing to do with my monastic order, and because they have nothing to do with my religious ministry, or with my setting up my religious ministry.

Just last night, some group of people droped by, and banged on my door, with the tip or barrel of a weapon, and it was rather hard sounding, and I just ignored them, and after a few minutes, or so, they went away, and they haven't come back, yet. I don't think they will, and even if they do, I don't think it will amount to any thing, as I may have occaisonal visitors or harrasment calls, now and then, but that's all they are, and I just won't allow my self to be bothered by them as they are unimportant, and my goof ball kids, are just too nutty to figure out that I am GOD, and that they are my kids. Nevertheless, these goof ball kids are here or there, and I get lots of compliments about my hat, and usually, if not always, the person giving me the compliment wishes to steal the hat from me, and then rob me, in any other way, he or she can, and then beat me up, if he or she can.

Well, I can't let these types of things get to me, and I just ignore them, as I walk by them, and I don't reply or return any statements to them, except a polite, 'thank you' if they gave me a compliment about my hat, but that's about all, and I might mutter something, like, and well, so that's just another one of my goof ball kids, or something to that effect.

Nollicking And Nollygaging

Nollicking means idiotic and foolish people who are wasting their time, for accomplishing nothing. It's like, nolly gaging, but nollygaging, is just wasting time, foolishly, and while you are nollygaging, you are looking for some way to make a profit, from your use of your time. Scanderously, you try to extort money from others, or force others to give you money, you do not have any right to. That's nollygaging, as I can recall, at the moment.

Goof Ball Kids, Their Mischievousness, And Maliciousness

Well, I have all kinds of kids, and many of them are malicious, if you give them a chance, so I just stay away from all of them, as I know most every one of my children, is malicious, from time to time, if given the chance, and I think that applies to all of them, regardless of their age, at some point in their life, they will commit crimes of one kind of another, against others, and not think much about it, except that, they just had to take care of that, as they wouldn't be happy, if they hadn't.

Okay, so every one of my kids, at one time or another, will do goofey or goof ball things, and not think much about it. That's the way it is.

There is nothing to be surprised about, as every one, and I don't care who they are, every one, does things they shouldn't do.

Me, personally, I get angry, and say nasty things, and make myself sound gruff, now and then, and maybe I shouldn't, but I just feel compelled to do that, when I have a righteous conviction that some one deserves my speaking up and telling them off.

Well, you feel sorry about it, afterwards, if you hurt some one's feelings, but then that's the way it goes, and no one is perfect, so it's just. Let's try to live and let live, and live together in peace, and cut out the naughtyness, and stop the mischiefness, if we at all possibly can, and apologise if the opportunity presents itself. That's always the best way to handle things.

Most people, after they kill someone, can't appologise, and young girls and boys, and older girls and boys, think nothing of killing people, or having some one killed, for them, and then of course, there is no way for any one to appologise to the dead person, since that person is in my Epcot Center.

Well, we can't do too much about that, can we, but we can try to be kinder, and not kill as much as we feel we must to be happy.

More Than Ninety Five (95) Percent Of The Homicides In The World, Some Times As High As Ninety Eight (98) Percent, Or Even Higher, Go Unreported, And Are Therefore, Not Investigated

It's too bad that we kill others, and torture others, but that's the way my goof ball kids live in my universe, and despite what people might wish to think, to the contrary, it happens every day, in every city, town, hamlet, county, district, or where ever. My goof ball kids are killing people, right and left, and there are just so many deaths, the police don't hear the ninety five (95) percent of them, or so, as they never learn about it.

The percentage of homicides the police do not hear about, is perhaps just a little higher, but in any case, no one should be surprised, as that is how my goof ball kids get along with one and each other, and they have been getting along with one and each other, that way, for a very long time, already, so it will not stop, any time soon, and that's just the way things are, for now.

The Lesbianists are responisible for just about eighty five percent of those homicides.

Labrynthine Cities Below Us

The Lesbianists living below us, in their cavernous, labryinthine cities, that are below the hard rock layers, well below the oceans, and other bodies of water, far below the continents, go around, and mess with every one, and they play with people, and they think they have the right to amuse themselves by useing the citizens of this planet, any old way they like.

They go around, and set up phoney wars, and they watch the citizens of each country, kill each other, on their commands. The Lesbianists enjoy playing these kinds of games, and they set up civilization after civilization, and they bring it along, and help to develop it, and when they get it to a high enough level, they feel a sense of accomplishment, and then they watch and amuse themselves as they destroy what they built up, and the people who are living, unawares of them.

The Lesbianists think it is funny, that the Lesbianists feed the lies about our universe, and the lies about science, to every one, and the Lesbianists think they have the right to bafoonerize every person who comes into our world, as a tummy baby, who is on his or her way in, and in fifty to eighty or so years, is on his or her way out.

The Valderizing Lesbianists

The Lesbianists do not teach real science, or real geography, or real history, or real mathmatics, or real chemistry, or real anything, and they fool every one with their bogus religions that they either made up or corrupted, and valderized. Valderized means, they vandalized it, and sprayed grafitti all over it.

Well, that's the way the Lesbiansts get their kicks, and they are just a bunch of grown up children, valderizing every thing they can, and disrupting every thing, and every bodies' lives, just for their own amusement, and cruelish fun and games, such as feeding former Lesbianists to my abominant kids, who are need to be fed, and who are smart, and devious, and who destroy humans, and eat them up, and spit them out, and treat them terribly, while the Lesbianists watch on, in amusement, as they see people like Bill Gates, or Steve Irwin, and others, eaten up and then tortured, as I've mentioned about before.

Valderize all they may, and be cruel all they may, we are all now finally finding out about their treacherous and horrid behavior, and now we are going to put a stop to it, permanently, and that means we will kill every one of them, and send them all to my Epcot Center, as I've explained about before.

Now we know we can cave in their cities, below the leaky hard rock layers, way down below, if we hit certain areas, hard enough, with a nice big hammer, such as one or more of my 'nuclear' bombs, the fracturable rocks kids bombs, with fuels oils, burning at extreme high temperatures, and with percussive shock forces, these, mixed together, will get my fracturable rocks kiddies, making lots of babies, and with a large enough fracturable rocks fuels chlorine, and metals that burn at high temperatures, nearing solar temperatures, we will see some very explosive 'family making' adventures, among my fracturable rocks kiddies, and their radiological relatives and friends.

We know where to hit some of their locations, to drop a few miles of more of continental shelf down onto the tops of their ceilings that will then fracture their ceilings, and cause massive damage, as oceans of water fill up their labrynthine and very well laid out cities, below us.

Who Do We Kill, First?

Mr. George Bush, Jr., Mrs. Barbara Bush, Jr., Mr. George Bush, Sr., Mrs. Barbara Bush, Sr., Mr. Ronald Reagan, Mrs. Nancy Reagan, and lots of their friends, and nearly the whole crew of politicians in Washington DC, are all Lesbianists, and I want you to kill every one of them, and send them to my Epcot Center, and I want you to place the fracturable rocks bombs, in the right locations, and then drop a thick layer of continental shelf, down onto their ceilings, their ceiling that are below the water that is between us and them, and that is below our continental shelfs that we live on.

We can hear the water down below, if we have the right types of listening devices, and if you find the right places to place your fracturable rocks bombs over, then it may be easier to drop your continental shelf, down through the water, below you, and down further onto their ceilings, the hard rock layers below the water, that is below your continent, swirling about.

Now I want you all to study this, and find the right places to drop your continental shelfs, down through the water layers below you, and onto their ceilings, so as to smash their ceilings. I've given you some hints, already, as to where you can place the fracturable rocks bombs, and my kids also have given some people more information on that, and so we have lots of people, who are interested in solving this problem of the Lesbianists toying with you, one life of yours, after the next life of yours. It is time we brought their mischief, and non sense, and cruelty to a halt, and it is time we put on the brakes, and slammed down on the brakes real hard, and at the same time, slam down on the ceilings of the Lesbianists labrynthine cavities, below you, their cities that they have laid out in perfect symetrical, geometric shapes, like perfectly shaped, honey combed behives, with central cities, placed symetrically around the globe, in a perfect geometric layout, and with spokes or corridors reaching out symetrically, to other central cities, and to satelite cities, that they have well planned out, and have well laid out, perfectly, below you.

Hydrolific Pressures And The Labrynthine Cities Below Us

Because of the hydrolific pressures, they can never keep the ceilings, perfectly dry, and they are always in trouble, trying to fix leaks, here, there, and every where.

Now it won't take too much to bring the whole place down on them, flooding them like rats in a cage, below the water line, as a boat slowly sinks with a rats' cage on a table, with rats in it, slowly into and below the ocean waters.

The ones above, such as George Bush, Jr. the current president of the United States of America, and his wife, and his supposed family and relatives, and all his close Lesbianists' friends, should now all be killed, point blank, with your fracturable rocks bombs. I hope that is perfectly clear, and I hope you all understand what the situation is, and that it is an intolerable situation, and we are not going to allow them to toy with us, any longer, and we are not going to let them amuse themselves, any longer, and we are putting an end to their games, now.

DO YOU UNDERSTAND ME? I HOPE SO! AS A 'NO SIR!' WOULD BE UNACCEPTABLE.

Now that we know where we stand, we have nothing further to argue about, and so let's get to our tasks, as soon as we are ready, and prepared. Okay? Good.

Local Area Prayerful Collection Site

A collection site is where people gather to pray, and to sexal and to purify each other. It is not a site where people ask for offerings, or where people as for any thing else, involving money. It is a sexaling park, and a prayerful sexaling park. That is the meaning of collection site. A collection site is where people collect together, to sexal and purify themselves, and while they are at it, they make sexaling efforts to help to purify others, by shattering and showering out megawatts and tons of radiating, purifying energies.

We have a local area park, at the corner of West Tropicana Ave. and South Decature Blud., a local BLM piece of land, that some people like to camp out in, that I go out to, to bless, and to purify with my religious ceremonies, now and then.

I claimed that area, and all other BLM lands that I could claim under Gurkian Law, and all other land on this planet, that I could also claim under Gurkian Law, such as other parks and forests managed by other government agencies, or private lands, supposedly owned by rich people, and lands around the world, that I have a right to claim, under Gurkian Law, and all that land, is now mine, under Gurkian Law, and I can use it in any way that I need to use it, regardless of what other people, think.

Aerobic Taichi Practice

I am busy, now and then, purifying that parcel of land, at the corner of West Tropicana Ave. and South Decature Blvd., with my religious ceremonies, that I conduct with my religious prayer hand signaling statements and with my use of my ability of arerobic Taichi, for religious ceremonies, as I seem to have recalled a lot of areobic Taichi, as well as some other forms of Taichi, that I knew, before, in previous lifetimes, but I am only interested in using it for practical purposes of religious hand prayer signaling.

I'm very clumsy when it comes to aerobic Taichi, but any way, I enjoy it, and it is good excercise for me, and the more I practice, the better I get, but it will be zillions of years, before I get any where near good at it. I practice the arerobic Taichi while I make my religious hand prayer signaling statements.

I don't teach Aerobic Taichi. I only use it for my prayer ceremonies, when I am on my feet, and not on my back, mostly, even though, I do use a short version form of it, while lying on my back, or, while I am on my side, I use a very short form of it. Anyway, it is fun to do Aerobic Taichi, and that makes my prayer ceremonies, for me, more fun. When other people learn to prayer signal, they will naturally pick it up, as well, as every one has studied to some extent, Aerobic Taichi, and other forms of the martial arts, and my kids will release the knowledge that is stored in your memory banks, as you need it, once you begin practicing, for women, as a priestess, or for men, as a priest.

It is not like the Taichi you see people doing in China, or Taiwan. It is Taichi, unless they are very good. It is specialized form of Taichi for use while performing hand prayer signaling. It is not used for fighting, but it is the basis for Taichi, and you can train in martial arts, while employed as either a priestess, or as a priest, and it will be useful to you to know, before hand, as it will make practicing your martial arts, that much more interesting.

I'm not hiring any one, now, or just yet, or any time, soon, as far as I know, as my kids do all the interviewing, and I have nothing to say, about who comes knocking at my door, to be interviewed.

Campers, Camping, Sexaling And Purifying The Area, And Useing The Parcel Of Land That I Publicly Claimed For My Setting Up Of My Ministry

Now, on that parcel of land, there may be campers, now and then, who want to camp there, because they want to find out more about my religion, and so they come out to Las Vegas, now and then, and they camp out there, on that parcel of land, at the corner of West Tropicana Ave. and South Decature Blvd.

Since that land is where I am going to set up my initial ministry, when the time for that comes, I am preparing it, with my religious purification ceremonies, and there doesn't seem to be any troubles, with any one telling me not to go up to my property, that parcel of land, and there is no one trying to tell me that I can not bless my property, that parcel of land.

Now, if other people wish to come to that parcel of land, and wish to sexal on it, and thereby purify that parcel of land, they are more than welcome to come to it, with their camper trailer, or caravan bus, and they can maneuver into the area, and set up a tent, and campsite, but there is no water, or any thing else, so you have to come prepared to rough it, if you wish to come in your camper van, or caravan bus, or in a camper trailer, or with a tent, or with other types of sleeping and living gear.

Straightening And Cleaning Up The Area

You can straigten up the area, and clean it up, and make it nice, for many people to pull into, to join together, and to sexal together, and with your purifying energies from your sexaling together, you are more than welcome to stay there, as long as you like, and as long as time permits, and as long as finances permit.

I have nothing there, except for my now and again, Aerobic Taichi practice and the energies that are imbued into the area, there, from my religious hand prayer signaling ceremonies. There are no structures of any kind, and I am sometimes there, busy purifying the area, with my religious ceremonies, so if you and your friends would wish to come to that area, and also help to purify it with your sexaling energies, than you are more than welcome to come and visit there.

Donating Your Sperm, Sexaling Spittle, Perspiration, Vaginal Juices, Titty Juices, And All Your Sexaling Juices

You men and boys may by all means, donate your sperm juices, sexaling spittle, and other sexaling juices, your perspiration you generate while you are sexaling, to the site, and you women and girls may by all means, donate your vaginal juices, your titty juices, your sexaling spittle, your perspiration you generate while you are sexaling, and all of your sexaling juices to the site, as they all will help to purify the property that I intend to set up my ministry on, as they all contain many, holy, pure, sacred, powerful cleansing energies, and GODLY energies in them, and they will help purify the land, and the environment for ages and aeons to come. All of your eroteming and orgasming energies will go shooting throughout your bodies, and they will find their way throughout your bodies, and out of your bodies and brains, and into the environment, and into your bodies' sacred and holy spillages, as I've discussed about before. Your bodies' spillages, as well as your perspiration, your pee, and your poop, not to mention all of your other juices that are produced as you sexal, erotem, orgasm, and phlumett, become pure, sacred, holy, powerfully cleansing, and GODLY, while you are sexaling, eroteming, orgasming, and phlumetting. Your pure, sacred, holy, powerfully cleansing, and GODLY energies find their way into all of your bodies' spillages, and so please donate them to the site, in appropriate manners.

Building A Latrine

Please employ some one to dig a latrine, and to fashion benches to sit on so as to be able to dump your poop, and pee your urine, into the latrine trenches. Manage the latrine, with care, and employ healthful, tactical, and sanitary techniques to use it safely. Provide hand rails, to grasp, so that no one will slip off and fall into the latrine. Provide barriers so that no one can accidentally fall into the latrine. Use your common sense when providing 'tactical' safety measures.

You need not fashion an over hang, as there is no rain to speak of, in Nevada. You do not need a supported roof, or enclosure, as they will only become stench ridden, and no one will enjoy useing them. There are to be no enclosure walls, or sides, or backs, so as to enclose the odors of the latrine, and confine them to an air tight area, where they can accumulate, and cause explosions, accidentally. They need only be deposited into a safely dug, latrine, and then allowed to filter down into the soil, and then allowed to vapor up into the atmosphere, freely.

No doors should be used, and no barrier walls should be employed, when fashioning the outside framing of the latrine facility, itself. That means, there are no hiding places in the latrine, where people can hide, and be prevented from entering, or exiting from the latrine. Only hand rails need be supplied, and only barriers that are suitable for keeping people from falling into the latrine, need by provided.

Steps may also be provided, to a raised platform latrine, which is more sanitary to use, than a level to the ground, latrine. There should be no walls, and no blind spots when either ascending up the stairs or when descending down the stairs. Women, girls, men and boys, should all use the same facility, and there is to be no fraternizing. Fraternizing is playfully tearing up at the opposition, or at people who you do not like.

Tearing up at the opposition means, you are trying to over throw the person, and dispose of that person, into the latrine. Over throwing the person means to be using reckless abandonment when dealing with another. Reckless abandonment means to be recklessly risking the life and limb of another.

There will be no frolicking at the latrine site. Frolicking is when little boys, and big boys, and little girls and big girls, play around and provide possible hazzards to others. You will not behave in a hazzardous manner towards any one, at any time, or you will be asked to leave, and to not come back.

There will be no play time allowed for children, as this is a collection site, and that means it is a holy site for holy activities, so leave brats at home, and do not bring any one who drinks alchoholic beverages, or who acts unwholesomely, to the collection site. This is a private site, and a prayerful collection site, and that means, you are coming there, to pray, and to make love, and to sexal, as GOD's children, so as to purify the site. You are not allowed to act randomly and with reckless abandoment. Randomly means, without proper self control and restraint. This is not a gay fashion, show or parade, and we will not tolerate reclusive, or unwillingly unwholesome behavior.

Reclusive means, unwilling to participate for the stated purpose of purifying the area. Reclusive means, caution and carelessness is thrown out the window, and you are acting in an irresponsible manner.

Unwillingly unwholesome means, first, unwillingly means, non cooperative, private, or sordid. Sordid means you are acting in a selfish manner, and you are not acting in a responsible manner for self and for others.

Unwillingly unwholesome means, thusly, that you are acting in a selfish manner, irresponsible manner, uncaring towards others, and unwholesomely.

Unwholesome means, you do not care about the life and limb of others, and you would just as soon shoot a person you argue with, as talk to them for a friendly chat. Many of my kids, are very unwholesome, and will just as soon, talk to a person, as shoot the person. You will not act in any such manner.

Any unsafe or prohibited latrine construction will be ticketed on detection, by me, and you will be asked to rework the facility. That will be on the ticket, and please comply, if you and your friends who built it, will be so kind. If you do not rebuild it, you will be asked, with your friends, to leave the site, as you are acting in an irresponsible manner. You will not be allowed back to the site, without your showing proper repensive behavior. Proper prepensive behavior is an attitude of appology, as well as the acts of appology which means, you will take appropriate steps to see that the work is or has been redone, in the manner as required by safety laws, as stated by my children, under Gurkian Law. Either me, or my children, will leave the ticket, and you will be required to fix what ever it is you need to fix, or you will be asked to not stay and conspiriate at the collection site.

Conspiriate means, to participate freely with caution and care for the sake of others. Conspire is also the same, as conspiriate.

You will be asked to not stay and conspire at the collection site, means, the same thing. It means, you will not be permitted to participate freely with caution and care for the sake of others. That means, you will be asked to leave, and you will not be allowed to come back, if we, my children and I, and other attendents, as well, can at all help it.

Attendents are people who participate in the collection site activities, and they are people who take responsibility to make sure every thing is done, properly, and safely, with the sake and safety of others, in mind.

The Home Depot has many nice and useful janitorial equipments, and so it will not be difficult to build a safe and luxuriously clean, and handy, latrine, that is safe to use, for all people, of all ages.

Luxuriously clean, means, it is kept sanitary.

How do you keep a latrine, sanitary? You keep it clean and sanitary by venting the air out, freely, with no blind spots, either underneath or above, where pockets of air, and vapors can accumulate.

No partitions will be installed that will create a blind spot. A blind spot is an area where light can not penetrate. Therefore, your construction materials, must be perforated wood, or grated steel. You can weld together, if you know how to weld, a very nice, grated steel, latrine, that will be safe to use, by every one, of every age. You will need the correct strength of supportive steel poles, to handle the weights of the persons accessing the latrine, and of the latrine, as well. You will make certain to build it well, and to support it well, with firm foundations, of concrete or steel plates.

Any deviation from safe practices for building latrines, will be torn down, disassembled, and the persons or person responsible will ethier be asked to leave, or will be asked to appologise to the memebers of the collection, sincerely. If the person acts in a responsible manner, and appologizes, sincerely, and appropriately, then the person will be excused, with out further, charges being leveled. Further charges will be leveled by my children, if my children detect further, reckless abandonment on the part of any person, participating and acting in a reclusive or recklessly abandoned manner.

Glue People Begun 'Cleaning' Agents

Cleaning the toilet seats of the latrine, will also help to keep the latrine luxuriously clean, and sanitary. You should clean the toilet seats and parts of the latrine, with common household detergent agents, as at this time, we have no choice but to use the unwholesome, Lesbianists' manufactured, ajax, spic and span, lysol, and other such 'glue people begun' agents. Glue people begun agents means, aerosols, and other unwholesome petrol fueled compacted or pressurized sprays, or detergents, that help the Lesbianists to begin the process of turning human beings into glue people. Glue people, in this instance, does not refer to glue, but it refers to tar. Tar is an adhesive substance, and their intent was and is to turn every human they can find into tar people.

We have no choice but to use the local distributors selection of cleaning agents, but in time, we will one day, have all that straightened out, after we demolish the Lesbianists' hideouts, under ground, and after we kill them all, or welcome them in, as 'surrenders', with appropriate, remorseful, penentant attitudes.

Removal Of Latrine Wastes And Disposal Of Latrine Wastes

Latrine wastes materials shall be removed, and supplied to local pig farmers, who can then use the materials, for feeding the animals. Pigs and hogs love to eat away at latrine wastages, and no one knows that. Chicken also enjoy eating human wastages, as well as ducks, geese, and other fowl. Horses and burroughs also enjoy human wastages, if it is healthy enough, with large amounts of vegetable mass in the diets of the human beings, whose wastages are carried to the farms for spreading about in the hogs and pigs, barrels. A barrel is a place where wastages are loaded, up into trucks for delivery to a sewage farm, or a place where farmers can use the wastages, that the hogs are finished with, as fertilizers.

Hogs and pigs use a roped off area, for eating wastages, and employees keep track of the unloaded wastages, and the spilled wastages from the hogs, and then the spilled wastages from the hogs, are then moved to a separate area, for pickup by carriers of farmers. Foods grown at farms using hogs and pigs wastages are useful and nourishing to humans, and other animals.

No fees of any kind for loading and for carrying away wastes to hog and or also pig farmers, should be levied by truck drivers, as drivers will earn a tokenous gratitude tip from the hog and or also, pig farmer. An appropriate payment to the driver and deliverer of the human wastes to the hog and or also pig farmer, should be paid by the hog or also pig farmer, unless the farmer is cash strapped. Cash strapped hog and pig farmers may be given money compliments by the people at the collection site.

Money compliments are small awards, or minor payments, out of gratitude to the hog and pig farmer, for his or her useage of the human wastes from the latrines. Money should be collected, regularly, if hog and pig farmers are cash strapped, and then given to the hog and pig farmer, out of gratitude to him or to her, and presented, tokenously, or as a gift payment. How much should be paid, depends on the expenditures of the driver, for his or her services, and for the use of his or her, vehicle, and for its whollyfied maintenance.

Whollyfied means, the regular maintenance that will allow the truck or vehicle to run at tip top conditon or shape, for the life of the vehicle, figuring it proratively.

Proratively means, spaced out, and paid proratively, or over the period, at regularly spaced points in time, over the given span or the useful life of the truck.

Discussions regarding this, and discussions for compensations, should be held at the collection site, and at the delivery site(s) for delivery of human wastes, by all parties, concerned, regarding all of this, and the primary collection site attendants, the persons elected by the attending or participating persons, at the collection site, who show the greatest interest and sense of responsibilities, at the collection site and with regards to the collection site, and with regards to the collection sites' safe, healthy, and wholesome management, must attend the discussions, and must deliver their sound judgements as to who is to be compensated payments for their participation in the removal and distribution of the wastes from the collection site, to the hogs and pig farmers, and as to how much should be dispensed, per each removal and delivery of human wastes.

Participating persons at the collection site, should elect attendants, and the attendants should regularly check on all points for the safe management of the collection site. Participating persons means, persons who are there for sexaling, and for depositing their holy, pure, sacred, powerfully cleansing, and GODLY sexaling juices at the collection site.

Nevada Power, and all other vendors, are not participating persons, and should not be construed as participating persons, regardless of what they might wish to think, and if they have any complaints, I authorise the killing of all persons who disagree, and persist in

Leveling The Area

Some minor leveling of the area, for maximum use of the area, as an automobile and camper trailer, caravan bus, travel trailer, campsite park, will need to be done.

There are many tiny hills, and a few large ones. There is much dirt that can be removed, from the middle of the site, all the way back to the rear edge of the site.

There is a hilltop trailor park, past the edge of the rear of the parcel, and there will need to be built a very durable, and strong retaining wall, to keep that hillside, shored up, and to keep the trailor park from crashing down the hill side, after slide begins, and creep causes the trailor park to fall into the open area, that will be needed to be excavated, all the way to the rear of the park.

The grade or slope of the hill, need not be steep, but can be at a relatively low angle of ascent. An angle of between ten to twenty five, to thirty degrees, in graduations, from front to back, can be accomplished, with little difficulty, and with no disturbment to the trailor park, or disturbment to the integrity of the trailor park.

We need not seek any permits for construction, as I do not recognize the Lesbianists' governments, on this planet, and if any person shows up who says he or she is a county or city planner, inspector, or whatever, you are to immediately kill the person, and deliver three fivers to the persons' head, as that person is a Lesbianist attempting to interfere in my religious activities.

All activities at the site are to be done, without any interference from any public or other authority, and all costs for all changes and alterations to the site are to be financed by the local construction companies, who are working on the hotels industry, and they will cease immediately their work on all construction, private housing construction, casino construction, and all other towers construction, or work construction, other than the basic infrastructure needed to support the present population of Las Vegas, Nevada.

We are taking over this town and you all will begin to prepare to vacate this town and hand over all of your construction equipment, now, or face your companies and your private persons destruction with my fracturable rocks bombs, begining with the New Orleans Hotel, and all related hotels, and casions, bars, and restaraunts. That means, every gambling establishment is to shut down, stop construction, and vacate this town, now, immediately, post haste, if you wish to live.

You will be destroyed if you refuse to follow orders. We are putting a stop to the non sense of the Lesbianists begining with Las Vegas, Nevada, Henderson, Pahrump, and all parts of Nevada and the Southwest.

You will disband your operations and hand over your companies, such as the water bureau, the power company, the gas utility company, and every other company, including all supermarkets, grocery stores, malls, and so forth, every last business in Nevada, and the south west, to the participants at the collecting site, to take over and then properly manage, until all residents of Las Vegas, remove themselves, to my kids facilities.

Is that understood? You are all resigning and moving into my kids place, underground, surrendering, and moving on for those who are not Lesbianists, but who wish to vacate this area, as this area is in whole, now, a religious grounds.

That means, that I will require the participants at the collection site to take over every thing, and to bring the news reporting stations to their knees, and force them to report the news, that every one is to retire to my kids underground, fortress, and they are all to remove them selves from Las Vegas, now, post haste, immediately, other wise, we will have a fractuable rock bombs throwing contest, to see who we destroy, first.

You must surrender all your holdings, owned property, equipments, and every thing else you call your own, and hand them over to the participants at the collection site.

Is that understood? "YES SIR!" had better be your answer, or you will find yourself on a one way ticket to my Epcot Center, with no return ticket, guaranteed, for however long it takes, to find you tummy mommies and tummy daddies.

I don't think there will be many volunteers, in the near future, as you are all abominant kids of mine, and the only kids people will ever bare, for some time to come, are abominant kids, and animals, and animal humans abominant kids, so I do not think you'll be leaveing my Epcot Center any time soon, if you resist and if you force us to kill you.

Is that understood every body? Good.

The penalty for not complying is death. Do you understand what I am saying? I hope so.

The Party Is Over In Las Vegas, And In The World

The party is now over, in Las Vegas, and at all casinos and gambling establishments, as we know you are all cheating, and we will kill every single last one of you to close you all down.

Who Is Staying And Who Is Leaving, Etc.

You will close down all of your establishments, world wide, and lock the doors on them, and then demolish them, post haste. Is that understood? I hope so. Either you do it, or we will do it. Do you understand that, now? I hope you do, because we are going to demolish every one of your establishments in this town, if you do not demolish them, yourselves. Every last one of them, all houseing, except for those noted in my children's compliance statements, which you are all to recieve, all trailor parks, with some exceptions, all every thing is to be removed, with only the basic infrastrastructure for heating, lighting, water, sewage, medical, hospitals, medical clinics, pharmacies, and so forth, food markets, services industry, HUD, Welfare, SSI, and other operations for the welfare of persons who are here, who can not leave, or who will be staying for some time, and who will be needing the services of those agences, construction companies, lighting companies, electric infrastructure installation and maintenance companies, as well as gasoline supply and distribution vendors, diesel fuels supply and distribution vendors, restaraunts, and telephone. That means, all humans are leaving, except for those person who are to stay on, as indicated in my childrens' compliance statements, and except for those who wish to stay on and participate in spilling their pure, holy, sacred, purifying juices, and those wishing to participate in purifying my area, all of Las Vegas, Nevada, the valley and beyond, in time.

Rules For Hospitals And Clinics, Etc.

There will be new rules for hospitals, and clinics, and my kids will see to it, that the new rules, are followed. There will be other rules, as well, and my kids will see to it, that they are followed, as well, or persons who wantonly disregard them, will end up in prison, underground. My kids have not only a living environment, they have prisons, as well, jail facilities, and many other things. Check with them for a fuller list, of what all they have in the way of facilities, as many are very nice, and there are great possibilities for improving your health, and rejuvenating your bodies, etc.

My kids have a full list of who is to be leaving, who is to be staying, and by when people are to be leaving, and where persons staying, are to be moving to, as we clean up this area.

All of you had better check with my kids, especially, you Lesbianists, but not only them, you religious fanatics, as well, and every one else, of course, or you, especially the Lesbianists and religious fanatics are at risk here, but not too much, the others who are to check in with my kids, risk dying, perhaps, prematurely, and then ending up in my Epcot Center.

My kids also have lists of who the people are who will be recieving all the properties for taking them over, which properties need to be demolished, who will be demolishing things, and how to remove those things that you must remove, and to where you will remove them, and dispose of them, and in what manner you will dispose of them.

You will hand over every thing, and you will all comply, and those who are required to hand over their properties, after complying with removal demands, will hand them over, and then will move out and into my kids place, in accordance with the time schedule that my children have for you to follow. You are required now to check in with my kids, get every thing sorted out, and learn all the details, and then comply.

Those who do not follow these orders risk an early and, fortunate for us, timely meeting with death, and entrance to my Epcot Center for a long stay.

Erecting A Partition Blind On West Tropicana Ave.

The roadway, West Tropicana Ave. runs east to west, and west to east, and it is advisable to erect a pertition blind, so as to not disturb traffic, that comes down the side of the road, the parcel of land sits on, at very fast speeds, with people rubbernecking to see what is going on, as many people will possibly end up flying into the area, with their automobile, truck, gravel carrier, or eighteen wheeler spinnning and turning over, out of control, and then sliding off the roadway and into the collection site.

The traffic is very fact on West Tropicana Ave., and with the interest of the local area residents, who will learn about the collection site, and the activities at the collection site, there will be many hazzards arrising as a result. Some persons may decide to stroll through the area, to steal purses, or wallets, or cameras, and so forth, as there are many poor, indigent, or hopelessly poor, persons, in the area, who do not have any work, and who can not feed themselves, and they need to steal things, to sell, to earn a living.

Such people should be spoken to, and fed, and then warned not to act in an unrighteous manner, which means, please do not steal things, or damage the property, or any thing on it, and please do not get into fist fights, over insults, and disagreements with participants, about who is GOD, and so forth. There are many impoverished persons from South America, and Central America, who only know their local area witch doctor's teachings on voodoo men and voodoo women, and who know nothing but folklorish stories about gouls and ghosts, and people, or ghostly gouls, i.e., people immitating 'gouls', or mean and rotten people, who go 'boo!', or try to scare and rob people, in the night.

Electricity, Lighting, Etc., To Be Supplied By Nevada Power Free Of Charge, Or Else

The partition blind should be sturdy, tall, and break proof, so that vandals can not break it down, or climb over it. Lights for use at night, with the proper permissions for an electrical hookup from the Power Company, Nevada Power Company, will be granted, and provided by Nevada Power, along with all other neccessary, needed, safety lighting hookups, to illuminate the area, fully, at night, so that it looks just like, or nearly like, daylight, or a well lit soccer areana at night, or a well lit professional baseball field, or football field, at night, and it will be given for free, lest we burn down Nevada Power, and kill all of their Lesbianists employees, and meter men, and all of their tawdry workers, who we do not wish to deal with. That means, we will blow up their buildings, and kill them all, unless they give us the electricity that we require. If we need to kill them all, we will then acquire all of their holdings, and we will operate all of them, ourselves. Fair Warning has been given, and consider that as a done deal, unless you wish to visit my Epcot Center.

Meat Vendors And Hispanics From Central And South America

An air of friendlyness, but caution, should be used. Men and boys are there to protect the women and girls. So, please work in teams, and do not let individuals, who might get kidnapped, and sold off to meat vendors, for a few dollars, or pesos, as it is, in Las Vegas, as the majority of such kidnappings and sales of human beings to meat vendors, the Lesbianists chain stores, such as Colonol Sander's Kentucky Fried Chicken, Burger King, MacDonalds, Jack 'n the Box, Wendy's, In-'n-Out, Fat Burger, Taco Bell, Dell Taco, and all the other, fast foods vendors, is by the locally landed hispanics from Central and South America, who need money, to stay alive.

Erecting A Partition Along South Decature Blud.

South Decature Blvd. also has much traffic on it, and there will be lots of people, rubber necking, to see what is going on, so a high, partition wall, made of lumber, should be erected down the side of South Decature Blvd. to prevent all such incidents of rubber necking, and reckess abandonment, from occuring.

The partition should be about ten to thirty feet high, and should be well constructed. Why so high? We do not want people climbing over it, to sneak into the area, to steal things, and to fight with people, and to cause trouble, and to come looking for young girls, and young boys, and helpless, elderly folks, and uneducated to the whims and ways of the downtrodden, brutal, abominant kids of mine, walking the streets of Las Vegas.

Yes. They are abominant kids of mine, and the proof of that is that their children come out as monkey people, and orangutan people, and chimpanzee people, and if possible, the hospital whisks the baby away from its mother, and disposes of it, in the prep rooms, used for killing incoming, abominant kids of mine.

Drawings On Demolition, Construction, Etc.

My kids have construction drawings for constructing all the facilities needed at the collection site for all the facilities that will be needed. They have electrical drawings for lighting, etc., health, fitness, and wellness facilities drawings, latrine facilities drawings, showers facilities drawings, food and beverage eating and drinking areas drawings, and all other drawings related to all things that will be needed to be constructed, or altered in any way, for our project to proceed, including but not limited to, demolition of the cliffs, leveling of the entire area out to Harmon Ave. and up to Flamingo, and back to Tropicana, as well as what is to be removed and leveled between Jones and Decature. There are a few minor exceptions, such as the building that I am living in. Who will move where, to consolidate staff at this project, and who will be moving out, at this project, and what will be leveled at this project, are all detailed in the program specifications, my children have.

My present quarters, will be my place of residence, as things move along, and in time, in accordance with the schedule for construction, a temporary facility for me will be constructed near the area but between Flamingo and Tropicana, and somewhere between Jones and Decature. Please see them for details.

After the area is purified sufficiently, and after all the areas to be purified, are purified, and my children will decide on when that is accomplished, my children will then activate the technologies, and acquire the resources they need, and then they will build a more permanent settlement arrangement for all people concerned, who are staying on, if they decide to stay on.

The partical dismissive technologies and remissive technologies, for foods, and medicines, and other items that are needed, for continued survival, and for all other required purposes according to the specifications for the sexaling for a living programs, will all be provided to the participants who wish to stay on, and houseing for them, as well, will also be included. Parks will go up, and so will many other locally needed facilities. Many things will disappear, as my kids will partical dismiss the things and structures they need to remove, as they construct the new area, for all persons staying on in Las Vegas. My kids have a list of all the names of all the persons who may, if they decide to, stay on in Las Vegas, and not all of them, are local people, so you should all check to find out whether you name is on the list or not.

All other persons, who are to be moving on, and all persons who do not wish to stay on, here, will be required to move into my childrens' present facilities, which they will continue to expand as we continue our program on this planet.

We will eventually clear every one out of the area, inside and outside of Las Vegas and the Valley, and surrounding areas, and the world over, except for the persons whose names appear on the list, as houseing can be provided above ground, for participants in the juices spilling and areas purifying operations, by my children, if those persons wish to stay on and participate.

All other people will be required to move into the facilities my children have, and are continuing to upgrade, and expand, in their encapuslated living environement, in which, many people currently live.

Persons in the encapsulated living environment, may also attend the collection site area activities, and future clearing activities, for purifying the areas with their pure, holy, powerfully cleansing, purifying, cleericating [cle-er-i-cating], and GODLY energies filled, sexaling juices.

Cleericating means, the same thing as clearifying. It is just a slightly different but related word from another a variant language of English, and to cleericate basically means the same thing as to clearify.

When we get the areas, cleared enough, and purified enough, my kids will then start building things for the participants. All others will move below ground, and live in the encapsualted living environement, until they have earned enough money, with their friends, as talked about earlier, to purchase a lease on land, and acuire the lease on resources needed, to build a home, etc., for a large group of people, who will be living together, and working together in the sexaling for a living programs, and so forth.

When Will This All Begin?

As soon as people begin to comply, we will begin our efforts to clean up Las Vegas, to begin with, and then, the rest of the world, and then, the rest of our universe. It will take a long time, as we need to spill our juices, the lay persons, anyway, for some time, to come, as our universe is quite large, and so is the rest of it, that we are going to be recovering.

My Spilling Of My Purifying Sexaling Juices, And My Spilling Of My 'Prayer Time' Purifying Juices

I spill my juices, only for religious ceremonialing activities, during certain relgious ceremonies, and I don't spill my juices, on the properties, as I'm not set up to spill my juices, on the property, now, and will not be set up to spill juices, until I find an excuse for that, and an excuse for performing a religious hand prayer signaling ceremony that will require my spilling of my juices. It's pretty hard to spill juices, when there are no other persons working with me, and I do not work with lay persons, unless they are confirmed by me, and so there will be maybe, some confirmations, but not neccessarily so, as I do not know who is going to wish to be confirmed, and by the way, who ever it is I confirm, must realize that I am the Mother and Father of all human beings, animals, and living beings, and the Creator of my universe. There are not that many people who understand that, except for my kids, my working, unionized kids, and so it will be some time, yet, maybe a few hundred or more years, before some one realizes, 'Hey, he IS the Mother and Father of all human beings, etc., etc., etc.,"

Spilling 'Prayer Time' Spittle Generated While Praying

Until then, I'll use my spittle juices if I need to drop or drizzel any juices, that I generate while I am religious hand prayer signaling, as I don't like or care for the idea of jerking off in public, to spill purifying juices, in public, regardless of the fact, that I am GOD, so it ain't going to happen, any time soon. When I find a authentic 'believer' who realizes and understand that I am GOD, and so forth, I'll begin my public spilling of sexaling juices. I don't mind it in private, but it is not going to happen in public.

Monkey Babies, Jimmy Carter, Oliver North, And The Lesbianists' Conspiratorial Bullshit Stories Of Adam And Eve, And "Jesus Saves"

Most people do not know this, but many births end in tragic loss of the child, because Jerry Falwell, Oliver North, Jimmy Carter, Ronald Reagan, George Bush, Jr. George Bush, Sr., and the rest of them, order and expect all the Lesbianists doctors to kill all babies born to people which do not look human.

Doctors at birthing hospitals also comply, quietly, as it is hospital policy they can not break. If they go against it, they risk losing their job, and possibly losing their life. This is not a joke, and it is the Lesbianistgs policy of having all birthings in hospitals exactly for this reason, for disposing of non human looking babies, at birth, so that their bullshit creation by God, of a 'pair' of people, Adam and Eve, and that "Jesus Saves all good Christians", can not be contested, by logical proof of non human births to human being couples, or single parent women or girls.

Abominant kids are born every day to my kids, on this planet, and they are all executed, or killed off by the local citizens, by their fright and fear of 'ghouls and ghosts' and 'goblins' in the night that go, 'Boo!'. These idiots, both the abominant South Americans, Central Americana, and all my other abominant kids, North American, Europeans, Russians, Chinese, Japanese, Thai, Philipine, and so on, must ask them selves why they are blessed with babies which are either not human or are abominant humans, or part animal humans.

If they ask them selves these questions, they will find out the only answers are that these people born to them, are my children, and my children are born to them for reasons that have not been disclosed to them, before, by the clergical societies, i.e, the religions of the world, and by the other societies, set up by the Lesbianists, or by societies nurtured along as part of the Lesbianists' 'tragic comedy' of their toying with your lives for their humoring themselves, and for their amusing themselves.

Once we get rid of the Lesbianists, and their ways of doing things, we will begin to see babies that are either not human, or are only part human, in animal bodies, and they will be born to all of you who are tummy mommies, and tummy daddies, if you birth enough children, to find out. How many is enough? About one in forty or fifty by my estimation, but depending on the person, it may be between thirty to eighty, from one person to the next.

Take that to our pastor, and tell him or her, to stick it up his or her ass. It is the truth that animals are born to humans, all the time. Not only that, but abominant kids of mine, usually of the apey kind, but not always, are born to the 'normal' looking humans on our planet, and in our universe.

We need not be afraid of these children, as animals, can be collected and put into zoos, and animal humans can be raised by the parents, or parent, in the case of a single parent.

In time, we will adjust to this reality, and we will raise fine children, abominant animal humans, or human appearing abominant children. That means you are all abominants, and the Lesbianists are laughing at you, and at themselves as well, as they go around and kill and cravenly torture every possible person they can.

We will put an end to their craven ways, and we will make a wonderful universe for all of us to live in, in peace, and serenity, once we get started practicing my religion, and once we begin erasing, sufficiently, our karma and our karmic markups, with your purifying sexaling energies, prayers, and other activities, such as syncopated dance, syncopated excercise, syncopated sexaling, and so forth. You time it to the metronome at one thirty seventh, for now, and that will be fine. In time, we will get accurate metronomes, and then we will chance the pace, just ever so slightly, to push my kids along, as I explained about, for our wholesome and healthy universe, for all of us to live in, together with each other.

Punishment For People Who Practice Voodoo Religions Is Dismendment, I.E., Death

We will not be killing or executing children any more, at hospitals, or at homes, or in primitive, backwards towns and villages, or rural hideaway villages, where voodoo religions muster the people into peculiar states of mind, where they become entranced, and then begin mindlessly, acting like chickens, and birds, or fowls, or hippos, and so forth. There are too many of these types of so-called 'religions' in this world, and we are out lawing all of them, and punishment for adhering to them, will be a trip to my Epcot Center, as I have my children particle dismiss their bodies, and then dismend them, bit by bit, into their base components, and then have my children whisk them into my Epcot Center.

We will bring every one up to the level of education every one needs to be at, to better understand my universe, and those who persist in abandoning their obligations, will be dismended with out further notice, after they are sent their last warning ticket, from my kids, in accordance with Gurkian Law. That also applies to the Lesbianists, and to every one else, who is unable to get the picture here, and get with the program. There will be no exceptions. And, this is not a joke.

My kids have courses for you to educate your self in, to pull yourself out of the past Lesbianists' way of life and thinking, and into the new and current, reality, that we will be living in, for ever, from now on.

Local Businesses Will Have No Problems At All With The Collection Site And Will Have No Problems At All With The Activities Of The Faithful At The Collection Site

Walgreen's is across the street, on one corner, and Home Depot is on another corner. I don't think Walgreen's will have any problem with you using the site for your camping, for your meeting with others, for your sexaling with others, and for you and your friends' purifying sexaling activities in that park, i.e., the collection site.

Home Depot, I don't think will have any problem with your use of the parcel of land, either, for those purposes.

What To Do If The Police Come?

Now, if the police come, and I'm there or not, I don't know what they'll say, but they have not got any right to say any thing to any one. Is that clear, Mr. Mayor of Las Vegas, and every one else in the area. I hope it is, as I am not going to stand for your interference or any one else's interference in my religion and in the relgious activities of people who wish to participate in my religion, sexaling to purify my universe. IS THAT UNDERSTOOD, MR. MAYOR AND EVERY BODY ELSE? I HOPE IT IS! AS A 'NO SIR' WOULD BE UNACCEPTABLE!

Now that we have an understanding, I think there will be no problems, and if there are, I will see what I can do about it, by calling my kids up, with my religious hand prayer signaling ceremonies, to see what they can do for you, to help you out, and to break the backs on law enforcement officers, and the Mayor of Las Vegas, and every other person, Lesbianist or not, who tries to interfere with me, or who tries to interfere with the people practicing my religion.

I will not stand for any interference from any one, including Mr. George Bush, Jr., the current president of the United States, or any one else, such as the Mayor of Las Vegas, or the Governor of Nevada, or the Nevada Highway Patrol, or the Nevada Sherrifs Dept. or the Las Vegas Metro Dept. or with any other persons or parties, such as the Las Vegas Gaming Commission, or any other Lesbianists' or Lesbianistic organization set up by the Lesbianists, and that means all you church goers, parochial school teachers, and students, and others, and if any one interferes with any one who comes to my ministry's claimed parcel of land that I am purifying for setting up my ministry, and if any one hassels any one there, than who ever is visiting the collection site, to help to purify it, you have my permission to kill the persons attempting to interfere in any way at all, on sight, with what ever you have to kill them with. Please dispose of their bodies in the nearest trash dumpster.

DO YOU HEAR ME? MR. MAYOR. YOU ARE A DEAD MAN IF YOU EVEN TRY TO SEE WHAT MY RELIGIOUS FAITHFUL ARE DOING, AND SO IS EVERY OTHER PERSON ON EVERY SCHOOL BOARD AND CHURCH OR OTHER LESBIANISTS' COMMITTEE. IS THAT CLEAR, EVERY BODY? GOOD!

You will not interfere with my religion, and with my religious faithful, and they will come to Nevada, and they will come to Las Vegas, and they will start sexaling on that property as they see fit. Does every body understand that? I hope so.

Now. Non responsive persons, who ignore my statements, will find themselves in trash cans, and trash dumpsters, every where in Las Vegas, and any where else, where there is a convenient trash can or trash dumpster. There are lots of them around, and people are throwing dead people into them, every day, across the country and around the world, and they all end up in landfill sites, and so there will be no added charges for our using the statewide Nevada Silver State trash retainers and containers, for however many others who need to be killed, and for my religious faithful to then place them into the trash cans and trash dumpsters.

No charges should be levied by any other Lesbianists' trash collection company, around the world, as they are all owned and operated by the Lesbianists, and we will not support them, in any way, what so ever.

If Mr. Mayor would like to be the first guest inside of one of the Nevada Silver State trash dumpsters, then he will try to interfere, in person, and he will be shot, point blank, in the center of his head.

You will then kill him with three fivers, to make certain he is on his way to my Epcot Center, for his next trip out as a tummy baby. If the Governor of Nevada wishes to interfere, then he does so at the risk of being shot, killed, and made certain he is dead, with three fivers, and then after that, he will be deposited into a local or state trash dumpster, either here, in Nevada, or in California, or Arizona, or where ever it is convenient to dump him into a trash can, trash container, or trash dumpster.

Lesbianists Enjoy Eating People, Who Are Alive, As Well As Eating The Bodies Of Those Who Are Dead

You should let the state's vice mayor of Las Vegas's office know, who was shot, killed, and confirmed dead, after depositing three fivers into his or her head, and then where the body is, and generally when the body was dumped, so that they can get an idea of how decomposed the body is, and whether or not the body is in a land fill site. They can then check on it, and verify that the body will make it to the land fill site, if it isn't already, there, where all the other bodies, are ending up, unless they have already happened to have beeb eaten up by the Mayor, or by the friggen Governor, or by the Sherrif, or by another Lesbianist.

All persons are free to travel to Las Vegas, and they are invited to stay at the parcel of land that I described, and they are invited to make it into a nice camper trailer area for recreational vehicles, or for what ever other types of outdoors camping vehicles, travel trailers, caravan buses, or any other types of camp site temporary stay, housing and living arrangements you would like to use the area for.

Every Game Of Chance, Gambling Machine, Or Slot Machine Is Rigged, In Every Casino Around The World, With Only A Few Exceptions

If you will all sexal, regularly, to the best of your abilities, and help me to purify the area with your sexaling, undisturbed by any one, and clean it up with your purifying energies, you are more than welcomed to come and enjoy the area, and see what fine attractions, will be leaving Las Vegas, in the not so distant future, including the gaming commission, with all their phoney, rigged gaming systems, that the Lesbianists control.

The Lesbianists' Articles Of Participation

The Lesbianists have every game that you can possibly rig, controlled by electronics devices, or by slight of hand, mechanics, who control the gaming rooms, and gaming halls, so that only Lesbianists win any money, that is worth mentioning about, and so that the Gaming Authorities, and the Mayor's office, and every other Lesbianist organization in Nevada, who has any one in their office, can then go and get the money the Lesbianist won, and get a percentage of it, given back to them, as they have arranged to do that, as that is part of their oath, and part of their sworn promises to do, as that is written out in their articles of participation, their rules for living upsite, not down below, in the labrynthine cities, and every Lesbianist must follow those rules, and when they win the Megabucks, and every Lottery in the world, they must give back money to the Lesbianists, as every game of chance that is run in this world, except for bingo, is rigged. However, even Bingo is rigged, in some ways, by people switching cards that look like winning cards, while players are not looking, and by other naughty tricks.

Every Lottery In The World Is Rigged

Every lottery in the world, performs the drawing out of the balls before a live audience, in most cases, before they actually air the show, and they have illusionary tricks they play, with the technologies they have, and they sucker people out of their money, daily, around the world. Las Vegas is no different, and they sucker every one out of their money, except for the Lesbianists, and they let some people, win now and then, small jackpots, on the gaming machines, and then after a winning streak, they set the machines the person uses, so that the person can not win a dime. They have the technologies for rigging every machine in Nevada, and across the country and around the world, so next time you visit one of their casinos, be sure and detonate one of our bombs, you can make, and destroy that casino. Is that understood? I hope so, as every day, millions of people are being suckered out of their hard earned money, they pay taxes on, through the nose, till they are practically choking, and the Lesbianists take it, and support their folley and games. They also support their folley and games with your revenues, that they make sure you lose, at every casion, and at every gas station, with a convience store, that has gambling machines in it, for you to deposit you money into.

Every lottery in the world is rigged, and so if you spend money on it, if you are not a Lesbianist, you are just throwing your money away.

No Fair Play In Nevada, And No Fair Play In The World

There is no fair play, here in Nevada, or any where else, in the world, and I would like you all to know that, and become aware of that, and then I hope you will tell your friends about it, and then I hope you will destroy every single last one of their casinos, and gaming machines.

We are not going to allow them to continue their frolicking at your expense, and we are going to destroy every last one of the Lesbianists, as soon as we can.

If they prefer to surrender themselves to my kids, than we can allow them to live. However, if they do not surrender themselves to my kids, then we will kill them all. And there are no 'maybe's' about that.

Sniper Shooting, And Miscellaneous Information

You have my permission to sniper shoot any police officer, park ranger, sherrif, or other person, plain clothesed police officer or detective, with or without a gun, on sight with your scoped rifles, and targeting assistant who will determine range, from your bunkered in the hillside, shooting site.

Any hotel in the area, which might harbor shooters from local police, sherrif, or SWAT team operations groups, you have my permissions, and blessing, or go ahead, and my 'okay, and 'approved for action' sight of appeal.

Sight of appeal means, my blessings, based on your determination as per your good judgement.

One hotel that is clearly the most convenient, and the closest with in shooting range, at close range, is the New Orleans Hotel. Hotels within shooting range, at a distance, are the Palm's Hotel, The Rio Hotel and Casino and its seperate tower wing, and a few others, off in the distance. You'll have to come and look at them from the approximate location of the site after you determine where every thing is, to locate and determine for your self which hotels and towers need to come down, and what you will need to bring them down.

There is a tower off in the distance, a new hotel, that is going up, that I do not know the name of, but is clearly within shooting range, and needs to come down, and people are on it, daily, welding, and you can't miss it, if you look in the north easterly direction from the site.

There is the Stratosphere Hotel and Casino, which also needs to come down, which is further over to the west from the new hotel wing that is going up. There are many scaffoldings in the area, that also need to come down with explosives, fracturables rocks, fuels, chlorine, and high temperature minerals particles ignition, and particles burnings bombs.

There are probably a number of other landmarks, hotels, casinos, bars, restaraunts, trailor parks, trailors, houses, apartments, condominiums, near or off in the distance, that also need to come down, and need to be demolished with my light weight explosives fuels, gunpowders, metals particles, and chlorine plastique explosives bombs.

You will destroy them all, and you will come prepared, or be prepared to acquire all the demolitions needed to destroy them all, as well as to destroy all the local police and sheriff's many Metro offices, SWAT Teams offices and units, Fire and Rescue Ambulance units, Lesbianists' Hospitals, and other Lesbianists facilities, throughout the Las Vegas Valley, Henderson Nevada, North Las Vegas, Pahrump, Mesquite and the whole Southern Nevada, westward to San Diego, California, northward to Los Angeles, northward to San Francisco, California, northward to Berkely, California to Oregon, and Washington State, and back down to Reno Nevada, Arizona, New Mexico, Albequerque, Houston Texas, Dallas Fort Worth Texas, and all areas where there are tactical SWAT team units, military units, militia units, as all militias are organized and operated by Lesbianists, despite popular beliefs that they are independent of the government, and anti government, as we often see on the "TV for the Brainless", as they are often refered to, i.e., the general public.

You will destroy all law enforcement offices, and personel, and all military and militias. All governments, their offices, and employees, are to be destroyed, and all personel are to be executed, except for those who take it upon themselves to execute the Lesbianists among them.

My kids have a full list of all the places and structures that need to be destroyed, and demolished, and so please see them for that information.

And to repeat, your orders are to kill the president of the United States, George Walker Bush, Jr. and all of his and his wifes' Lesbianists' associates, pretend relatives, and friends.

We are not going to let this stand, another moment, and if they do not surrender to my kids, you are to execute them all. My kids have a list of names, of those, who have not surrendered, as yet. Please see them for and ask them for that list of names of persons who have not as yet, surrendered, and who need to be executed, post haste, immediately, or, ASAP.

United States President George Walker Bush, Jr., is no exception to this, as he has not surrendered, as of yet, and that is confirmed. Neither has any of his colleages, or congressional office holders and diet or congress members, except for Ted Kennedy, and one or so others, and maybe a cabinet member, one or there abouts, but I haven't confirmed that, yet. There are some members of the congress who are not Lesbianists, and you can get their names, on a list from my kids, as well.

Captain Off The Bridge.

Texas's Lesbianists' Latest 'Vaccine' And Texas's Attempts To Destroy Women's And Girls' Vaginal Lining And To Destroy Women's And Girls' Cervical Lining, Causeing Stillbirths To Increase, So As To Prevent The Successful Birthing Of Children - Latest Lesbianists' Vaccine Will Cause Numerous Problems - Execute United States Of America, State Of Texas, Governor Perry And Family - Underground Books Distributor's For Militia Types Folks - Information On Bombs Making And Detonators On The Web - Solar Flares And Flare Igniters - The Lesbianists' Balooney On Minus Charges As Opposed To Positive Charges - The Lesbianists' Maps Of The Brains - Execute The Current President Of The United States Of America, George Walker Bush, Jr. - Lesbianists Who Decide To Sexal In My Religion With Lesbianists And Non-Lesbianists' Persons - Citizens By Proxy - Temporary Full Time Citizens - What To Do About Untimely Pregnancies, Health Issues, Medicines, And Regroverative Formulas - Medical And Housing Benefits, And Other Health And Work Related Benefits - When Can People Begin To Come So As To Be Able To Participate? - Sniper Points, Places Where Snipers Shoot From - Pocket Knives, Construction Tools, And Miscellaneous Daily Life Management Tools And Equipment - Hookups For Travel Camping Vans And Similar Vehicles - Cleaning Up The Area And Throwing Away The Garbage - Schedule For Leveling Of The Ground And Hills In The Area, Removal Of Unsightly And Smelly Garbage - Setting Up New Facilities - Fountains And Showering Lamponeers - Restaraunts, Clubs, Lounges, Eateries, Cafeterias, Bars, Pubs, Bicyle Paths, And So Forth - Dealing With Criminally Minded Persons - Alterations, Modifications, Changes, Clearing Up And Removal Of Garbage In The Areas, And Additions Time Schedules Updated: 12-02-07 Rev.a.00.a 02:30 PST

Texas's Lesbianists' Latest 'Vaccine' And Texas's Attempts To Destroy Women's And Girls Vaginal Lining And To Destroy Cervical Lining, Causeing Stillbirths To Increase, And To Prevent The Successful Birthing Of Children

The latest attempt by the Lesbianists' governments of the world, near by my computer window, on the internet news services, to destroy and toy with the human population of this planet, has been launched in

Texas, and is targeted at women and girls, and their ability to have children.

See the article at the end of this post.

The new vaccine, which is mandated by Governor Rick Perry, who signed it into law, and is now obligatory, unless you protest it, and go to court, and spend years fighting it, as an individual or small group of claimants, will destroy the vaginal cervical collar and the lining that holds every thing in place, and supports the interior of the vagina, thus making it impossible to carry a fetus to term. The vaccine is also targeting the brains fibers throughout the human body, and the fibers of the brains in a woman's or girls' body will slowly rot, and decay as they are eaten up by tiny animals that eat these energies conducing fibers, synapses, relay switches, and other related energical brainal related things and dings thoughout the body.

Latest Lesbianists' Vaccine Will Cause Numerous Problems

It will also speed up the eating away of the enamel of the teeth, and of the bones in the woman's and girl's body, her fingernails, and her skin membranes NS membraneous tissues throughout the body, and on the exterior of a woman's and girls' body, making the women and girls grow older looking at ever more younger ages, and making women and girls susceptable to skin cancer, melanoma, herpes, genital warts, other infestations of animals in the skin, and other skin related membrane destructing colonies of animals, that they use from out of their Bio Chem War encyclopedia of how to destroy human beings, with poisonous and health problems causeing crystals cages animals of all kinds. Especially numerous are the Bio Chem Warfare crystals cages animals of the petroleum industry's based kind.

The vaccine is no different from any other of the Lesbianists vaccines aimed at destroying the health of the people who live on this planet. It is compared to the 'polio' vaccine, in the news article, and that was similarly an attempt at destroying the health of the human being, by making the human being incapable of haveing any sexual orgasming capabilities, by killing off all the sex related animals and bugies in the body, which make sexaling juices, that make eroteming and orgasming possible.

Thus, this latest attempt at destroying the health of the people who live on this planet, locally, in Texas, and that I know of, anyway, is nothing more than the Lesbianists toying with the people who they are here to amuse them selves with by destroying them, little by little, over a long period of time.

Execute United States Of America, State Of Texas, Governor Perry And Family

This will not stand, and you will all destroy the capital of Texas, and Governor Perry's mansion, and the Governor and his wife, and their family, pretend or otherwise with my fracturable rocks and fuels chlorine and explosives, etc., bombs, that you will make in your home's garage, or workshop, safely.

Underground Books Distributor's For Militia Types Folks

Use the delayed timer invention, that is a workable time delay detonator, that I've explained about, especially if you use black powder gun powder, mixed with axel grease, turpentine, benzine, chlorine, using also some Elmer's glue, prior to mixing with chlorine, and then set it in a warm cupboard, to ferment for a few days, to then turn into a nice plastic explosives mixture for detonating with the string of flash bulbs wired to the alarm clock trick, as described by Ragnar or by one of the other bombs making specialists, in their sub culture literature for militia types folks, who wish to destroy the government.

They find the list of names of all the people who request the literature, by mail, and then they go and watch them, with their surveilance technologies they have, and then they either capture and torture them, and then kill them, or they just make sure they are die, in a fatal car accident, or whatever.

Paladium Press is one of the Lesbianists' book publishers, and there are others, and this one is affiliated with the National Rifle Association, a Lesbianists organization.

This publisher has titles sold to underground books distributors, and you can find a number of underground book distributors on the internet, which carry more titles than Palladium press.

Delta Press, who publishes their books and paraphenalia distribution listings magazine, 'Delta Force' is one of these distributors of interesting underground literature.

http://www.deltaforce.com/catalog/page30dp.html

'Home Made Fireworks', is one web page to look at, if you have the time.

http://www.deltaforce.com/catalog/page28dp.html

'Booby Traps, Explosives and Black Medicine', is another useful page to look at, as well.

http://www.deltaforce.com/catalog/page30dp.html

There are a number of other distributors of underground literature, and some have better selections than does Delta Press.

In any case, with a little research, there are plenty of 'timed detonation devices' drawings, and explanations, for you to view, and learn from, that will help you to construct a timed detonator, that will allow you to safely set off one of your plastiques bombs made with my explosives formulas.

Paladin Press, you can find their books at Amazon Books on the web, another Lesbianists owned corporation, is another publisher of interesting underground literature, that can be useful for you to study and learn from.

Paladin Press can be found at, http://www.paladin-press.com/

Books for supposed 'Professionals' who are anti terrorists professionals, that allow them to detect the different types of bombs people can make, and then use to destroy others, is sort of a tounge in cheek joke of the Lesbianists, for luring in people who wish to find information on bombs and explosives.

There are many useful books published to help beginners understand the basics of bomb making. The idea is to use the information for professionals who wish to understand the craft of making bombs, and detonating devices, and then use that information to build your bombs and your detonating devices.

The flash bulbs wired to an alarm clock with matches and ignitable phosphates glued to a string of flashbulbs, wired properly together, then crushed, so as to expose their flash and heat ignition coils filaments, for your detonating heat energies ignition needs, is one of the basics and you can find it in one or another of the underground books on bombs making and detonation devices making for 'professional' anti terrorist's private investigator or bombs detection professionals types.

This is one of the ways the Lesbianists lure in persons who know nothing about weapons, and then they find out who they are, and then they make friends with them, and toy with them, and introduce them to their Lesbianists' friends, and hang out with them, and pretend they are all friends, then one day, they all attack the person, and torture the individual, and get their kicks, amusing them selves, by ripping the person up, or by hanging, and nailing the person to a wall, with a nail gun using, approximately, three inch nails, and then hammering in longer, seven inch to twelve inch nails, or larger ones, or other similar nonsensical, childish, but fiendish behavior.

The "BRUTAL ART OF RIPPING, POKING & PRESSING VITAL TARGETS"
"by Loren W. Christensen"
http://www.paladin-press.com/detail.aspx?ID=1441

Is a beginners guide to ripping people apart, one arm, or leg, at a time, or with team work, one half of a person can be ripped from the other half, if you hold the right bones in place, and then, using teamwork, rip the person into two or more pieces. This book gives a person a preliminary sense of what he or she can muster, as an individual who attempts to rip at a person, and tear the person apart, one limb at a time, or with friends, how to rip a person up, one piece or more, at a time. Ripping people up is accomplished best, if they are unconcious. If they can not fight back, or resist, it is easy to rip a person apart, if you have the needed strength. Since many people have ancestors who were monkeys, chimps, orangutangs, guerillas, and so forth, with tremendous muscles strength, there are lots of very tiny persons, with phenomenal strength, and they can easily rip a person in two, by them self, if they try.

Books on booby traps for law enforcement personel, are simple descriptions of bombs that they may or may not encounter, and there may be some useful information in some of them such as,

"BOOBY TRAP IDENTIFICATION AND RESPONSE GUIDE FOR LAW ENFORCEMENT PERSONNEL"
"by Tony L. Jones"
"This manual teaches cops and other law enforcement personnel all they need to know to recognize a booby trap and respond properly. Find out where booby traps are most commonly employed; the 11 physical signs that most often signal a trap; what to do (andnot do) if a trap is suspected or found; how to safely search a building, outdoor site or vehicle; and the one indicator that practically guarantees that a building has been booby-trapped. Shows more than 90 different booby traps in place. For academic study only. 5 1/2 x 8 1/2, softcover, photos, 80 pp."

There are others, which you can also find, that will provide schematics, and drawings of useable ambush related devices, and detonators for them.

"Contingency Cannibalism", sold through Paladin Press, and other 'underground' book distributors, is one of the Lesbianists' favorite books, that help them to track persons who they would like to later, cannibalize, themselves, as a joke on the person.

"CONTINGENCY CANNIBALISM"
"Superhardcore Survivalisms Dirty Little Secret"
"by Shiguro Takada"
"This twisted, tongue-in-cheek look at cannibalism as a last-resort survival option analyzes real-life case studies and historical episodes of cannibalism. Then it examines the hard-core decisions and gruesome details one must know in order to partake in this grisly practice. Recipes included. For entertainment purposes only. 5 1/2 x 8 1/2, softcover, 160 pp."

The Rusksack, "Survival Information Clearinghouse", is just one club of members of mainly Lesbianists, who have fun toying with the people who live on this planet.

http://therucksack.tripod.com/survival.htm

Information On Bombs Making And Detonators On The Web

For information on making detonators, and other bomb related stuff, please see this web page as it costs nothing.

http://www.bombshock.com/archive/Homemade_Bombs/

Solar Flares And Flare Igniters

A solar igniter as talked about in the article on page,

http://www.bombshock.com/file9/crtrmkr.txt-Crater_Makers-932.htm

'Crater Makers', is a solar flare igniter, a device that is used in solar flares, or night time distress signal flares, that ignite the flare, by sending an electric battery current into the flare phosphates holding tube, down a wire, on an ignition circuit, and then igniting the distress signal flare.

You can find solar igniters inside of distress signal flares that are used on boats, for shooting up into the air, with a flare gun for maritime use, that will send the distress signal flare up into the sky, if you have the flare gun pointing in that direction, and then at a certain altitude, a trip switch circuit is activated, due to air pressure, or due to timing from time of departure of the distress signal flare from the flare gun barrel.

You have to exhibit extreme caution, when taking a flare apart, as it can detonate, accidentally, and they are not made in a way so that people can safely take them apart, and people who try to take them apart, are accidentally injured, on a regular basis. Do not use this, if you do not know any thing about demining, as a professional mine deactivating specialist in the military, or with military training. This is best left up to the professionals, and is not meant as something the average house wife, business man or business woman, or chemistry or other studies, school student, should attempt.

You can use a flash bulb, and get the same results, if you glue some gun powder and phosphates to the flash bulb housing, and then crush the glass, and then wire it properly to a common house morning wake me up, alarm clock with a striker bell and a striker that moves back and forth. The circuit is simple, and you can figure it out with little difficulty.

The Lesbianists' Balooney On Minus Charges As Opposed To Positive Charges

Remember the minus sign on a battery is where all the activity of the little energies kids is going on, and the Lesbianists purposefully teach that the positive side is where the current is moving out of, and around towards the negative side of the battery. The Lesbianists teach that the active side of the battery is the plus or positive side, or the side with the plus sign on it, when you look at a common house hold nine volt battery, and that the non-active side is the negative side, or the side of the battery with a minus sign. This is false. The side with the minus sign on it, is the active side, and that is where you do not want to wire any thing to, unless you know what you are doing. The positive side has no activity going on, and is safe to touch, but the other side is not safe to touch, and the testing meters are wired to show you that the reverse is true. They have tampered with the design of testing meters, so as to support their allegation and falseity, that the minus side is where there is no activity, contrary to the truth.

That means, that, the flash bulb igniter system and the flash bulb itself should indicate that one side is the positive side, for the positive wire to be attached to. You had better check carefully, and make sure there is no mischief here, as you do not want to detonate your igniter, accidentally. Ask a qualified electronics specialist to do all your wiring of your detonators, as he or she is the only person qualified to wire these types of detonators.

The Lesbianists' Maps Of The Brains

It's rather confusing, the way the Lesbianists have reversed things, and have messed around, so as to thwart your attempts to make nice detonators that work every time, unless you have a normal set of brains, which unfortunately, I have not got a pair of, or triple set, or more of. That's sort of a joke. On a magazine, yesterday, I saw how the Lesbianists teach that one part of the brain is for speech, and one area of the brain is for speaking, and one area of the brain is for sight, and one area of the brain is for logical thinking, and one area of the brain is for signing, or one area of the brain is for artistic inventioning, and so forth, but that's a lot of hog wash.

The brain is not partitioned in that way, and they know it, and they are misleading every one, and laughing at all of you while they are doing it, with their 15th to 17th century style drawings, that they have plastered on all the Time magazines, or what ever magazine cover it was on, that I saw in the check out lane, at the super market, yesterday. You have kazillions, and more of parts to your brains, and there are so many, it is unlimited, nearly, and your brains are so complex, and you have got brains in lots of other places in your bodies, other than in your head, and I'm not going to go into that one, now, but the Lesbianists are lying through their teeth, when it comes to this type of pseudo historically backwards, archaic, or cave dwelling human's notions on science, that should insult a first grader, or kindergarden school student, or preschool student.

In any case, ask your local electronics' specialist or house hold electricians' specialist, or handy man repair persons, who work for house hold water heating devices installation companies, or other electrical home appliances sales and installation companies, who also get confused, from time to time, as I've witnessed them, personally, blow up breaker circuits.

Get a qualified, and that's hard to find in so far as I've witnessed them at work, electronics' specialist to wire your detonators, or go take a course with my kids, as they have courses available on wireing such devices.

There is no minus charge, and there is no positive charge, and that is what you should understand. There is a side to the battery where there is lots of activities going on, and that is the minus sign side on the battery. The positive sign side on the battery is where there is little to very little or nearly no activity, but no activity is not the truth, either, as there is activity, you just can not measure it with todays' electronics measuring devices, as they are not technologically sophisticated enough to be able to detect the activity, though I'm sure there have been intrepid scientists who discovered that both sides of the battery have activity, and then they were shot and killed, after that discovery, by a Lesbianist assasin, or by a hired assasin, assigned or paid to kill the scientist who discovered that there is activity at the 'minus' side of the battery as well as at the 'positive' side.

That means, that you need only concern your self with the 'minus' side, since you will not be able to detect any thing at the positive side, unless you use the reverse wired electronics and electrical energies detection devices that the Lesbianists market through Tandy, or Radio Shack, and at Sears, and so forth.

It gets confusing, a little bit, doesn't it. Anyway, go and take a course at one of my kids classes, after you sign in, and swear in as a jr. member to our new country, which I haven't sworn on to, as yet, or joined - but though I am the boss of, regardless - since my kids do not speak to me, on a daily, or weekly, or other basis, and I just happen to be able to know what they are doing as they tell me what they are doing, through some secret port hole in one of my brains some where, in my toes, or nose, or who knows where, as they telegraph or some how signal in, using semiphore signaling, or probably hand signaling, that my brain then catches, and then passes on to me, their messages that they signal in to me, and the news, as well, about what they are doing, and about what is going on with them, and about what is going on with some other things, as well.

Since I am GOD, I happen to have a right to know this stuff, what they and every body else is doing, on a daily basis, but they haven't told me how my brains catch their information, yet, or the other information that gets there, some where into my one or more of my brains, and I haven't figured it out, yet, myself, either, though I think I know something, a very little something, about how it works.

This does not mean, that my brains are unreliable - except for my memories areas of my brains, in particular - but that I am just waking up to what is going on, here, and I have a few kazillions of years to work out every thing, or some of the basics, any way.

In any case, you have all been snookered by them, with regards to their non sense sciences, and you are being laughed at, and toyed with, daily by them. That happens to be the truth, whether we find it pleasant or not.

Execute The Current President Of The United States Of America, George Walker Bush, Jr.

In any case, the Lesbianists are a twisted group of individuals, who toy with the people who live on this planet. Mrs. Hillary Clinton, Bill Clinton, George Walker Bush, Jr. President of the United States, his wife, Barbara Bush Jr., George Bush, Sr., former president, and his wife, Barbara Bush, Sr, are all gagsters, or jokesters, who wish to only toy with you, and eat you, or deprive you of your life, and of your rights, in fiendish and horribalistic ways and manners.

They are all to be executed, especially George Walker Bush, Jr., President of the United States of America, currently residing at 1600 Pennsylvania Ave. Washington DC, in what they call the White House. You are to kill them all, and send every last one of them to my Epcot Center, as soon as is convenient for you.

Lesbianists Who Decide To Sexal In My Religion With Lesbianists And Non-Lesbianists' Persons

If any Lesbianists decide to sexal in my religion, with their friends, and their friends may include other Lesbianists who decide to sexal, as well, as well as, other people they know, then they may begin sexaling with their friends in my religion, however, they must have a pentative attitude, and they must say they are sorry, and they must now and then, when they feel they wish to, and feel emotionally and mentally capable of speaking about it, they can talk with their friends who they are sexaling with, and with others who wish to listen as well, and they can denounce the Lesbianists by telling people about the things the Lesbianists do, and did.

If they decide to do this, this is the same as surrendering, and my kids will protect them from other Lesbianists who might want to harm them. They have not sworn in, as a citizen of my and my kids' country, and as citizens of our country that every one is swearing in to as citizens, but it is sort of a promise to swear in, informal gesture that they are committed to, once they begin sexaling with their friends, and with other Lesbianists, who also wish to sexal and in time, denounce the Lesbianists with them.

Citizens By Proxy

By denouncing the Lesbianists organization, and by telling people about what the Lesbianists do and did, they are essentially stating they are sorry for what has happened, and that is a pentative attitude, and with that pentative attitude, they are accepted as citizens, by proxy.

Temporary Full Time Citizens

Citizens by proxy means they are accepted by my kids as pentative persons, who wish to join our country, and who there with, qualify as citizens of our country, in an informal manner. Citizen by proxy means, they give up their old citizen ship, to whatever government they used to belong to, and they are taken in, as temporary full time citizens.

Temporary full time citizen is a term that means they are full time citizens, but on a temporary committal agreement, and that will be made permanent when they have the chance to meet with my children, and then can swear in, as a permanent full time citizen.

They can then participate at the collection site, in the activities that will be going on, with others, who wish to participate, as they spill their juices, and purify the area with their sexaling juices.

What To Do About Untimely Pregnancies, Health Issues, Medicines, And Regroverative Formulas

My kids will deliver to them, to the men and to the women who surrender and become citizens by proxy, and temporary full time citizens, the needed medications that will help to make their bodies, wholesome and well, and regroverated, as well as the medications that are needed to prevent untimely pregnancies.

Medical And Housing Benefits, And Other Health And Work Related Benefits

My kids will make certain that they will be given the right medications, and my kids will also provide all the same medications for each individual who participates in the collection site activities to purify the area where we will one day set up my ministry with my kids assistance. My kids will also set up other facilities, as well as the ministry facilities. The other facilities will be scattered through out the valley, and they will be the houseing units and other facilities for people to use to become physically fit, well, and well nourished, and healthy, such as gyms, aerobic studios for practicing aerobic dance, and aerobic excercises, as well as sauna and health spa, and swimming, tennis, badminton, cricket, and other sports facilities for baseball, rugby, foot ball, for those who wish to play a friendly game of foot ball, now and then, with the needed bleachers, lighting, and other supportive facilities for allowing persons to attend and watch the games that are going on, not only for foot ball, or for base ball, but also for tennis, soccer, rugby, and all out door sports facilities that will be needed.

When will my kids set up these facilities? They will set them up at the same time or shortly there after, as my kids begin to set up my ministry facilities, and the needed facilities for living and working in the valley area, sexaling for a living.

At that time, the citizens by proxy, and all other persons who have not yet sworn in, but wish to, will have the opportunity to swear in, and then they can enter and use the facilities full time, twenty four hours a day, without any further discussion about it.

All people who participate in the collection site activities, are also citizens by proxy, and as such, will automatically qualify for all medicines, all health supportive medical formulas, and all youthfulness prolonging, or regroverative formulas, that will feed all the amoebes, and other cells, or living beings in your bodies, and that will feed all the living beings in your bodies, that will then allow you to enjoy full regroveration of your body and rejuvenation of your youthfulness, youthful energies, and of all the other health benefits that accompany a youthful body, such as more energy, a stronger libido, a more healthful body, and so on.

When do people begin this participation in the collection site activities? As soon as they come out here, to Las Vegas, and arrive in their camper trailers, or caravan buses, or other vehicles, or with their camping gear such as tents, and cooking grills, and so forth.

When Can People Begin To Come So As To Be Able To Participate?

How soon can people begin coming to participate at the collection site in the activities that will be on going at the collection site for some time to come?

They can begin coming to participate any time. My kids will watch out for the safety of all the people who come to participate in the collection site activities. My kids will prevent accidents such as current Lesbianists shooting at people at the collection site, from high rise towers, scaffolding, tall cranes, or from hotel and casino properties owned by the Lesbianists, and from other tall condominium and also from tall apartments buildings and also from normal sized, two or three storey, to eight or so stories, apartment buildings, in the area. Of course, my kids will prevent accidents from happening such as shootings, from all possible locations, and not just from those named structures and locations.

Sniper Points, Places Where Snipers Shoot From

There is no need to blow or destroy them with explosives, in Las Vegas, as there will be no way any one can use those hotels, and other structures, as shooting or sniper points, places where snipers shoot from, to harm any one who is participating at the collection site, in the collection site activities.

In time, every thing will be worked out, and all the people who must hand over their companies, or disolve their companies, and sell or get rid of the assets of their companies, all of that will be in compliance with my childrens' instructions with regards to it, as I've stated about it, already, in brief.

Once the facilities are set up by my kids, and people swear in formally, then my kids can begin to pay people their earned income, for the work they did as they sexal for a living, and for their work, as they spill their fluids, to purify the collection site, the collection site area, and the general vicinity.

Pocket Knives, Construction Tools, And Miscellaneous Daily Life Management Tools And Equipment

No one needs to bring weapons to the collection site area, or to Las Vegas, as they will not be needed, and pocket knifes are okay, and construction tools are okay, but they will be for daily use activities, only. Daily life management tools are forks, knives, spoons, chopsticks, plates, dishes, glasses, coffee cups, can openers, bottle openers, cork pullers, and these types of things, as well as all the other types of kitchen use tools for cooking food, for eating food, for drinking beverages, and for the collection of garbage, and food wastes, and for cleaning up their eating and cooking utensils, such as portable wash basins, and portable gas stoves, or fixed stoves, fixed wash basins, fixed showers in camper trailors, and in caravan buses, and so forth.

Hookups For Travel Camping Vans And Similar Vehicles

We have no hookups at the site, for water supply, electricity, or sewage, as yet, but the instructions that my kids will make available to persons who come in to my kids' underground facilities - the protected and encapsulated living environment - those persons who go in to recieve the instructions, and other information they must recieve on companies and assets, and persons moving on, and on persons staying, and other information needed to successfully carry out the removal of hotels, and the demolition of buildings, etc. which my kids will handle with the technologies they have available to them for their use for these purposes, and for other purposes.

Cleaning Up The Area And Throwing Away The Garbage

My kids will also handle the required steps for clearing up of the litter and garbage in the area, all of Las Vegas, Pahrump, Henderson, Laughlin, Mesquite, North Las Vegas, Arizona, New Mexico, California, Utah, and beyond, above ground and below ground, and for cleaning up the areas, and for removing the underground and above ground garbage, or city buildings and Lesbianists' structures, and all structures that are no longer needed, train tracks, airports, roadways, bridges, parks, hospitals, medical clinics, and so on, all of which will no longer be needed.

Schedule For Leveling Of The Ground And Hills In The Area, Removal Of Unsightly And Smelly Garbage

Initial leveling of the grounds' areas, leveling of the uneven surface areas, and leveling of the sloping areas, and of the tiny hills, and other uneven and unuseful features to the area, such as hills, low cliffs, and removal of unsightly, smelly garbage, will be done by my kids, with the technologies they have available to them, according to the schedule for making these types of changes, and cleaning up of the area, so as to make the area, one hundred percent, useable for collection site activities, for people to then come in and use the area as a collection site.

Setting Up New Facilities

My kids will take care of all of that, and they will take care of all of the work and tasks for setting up a private collection site area - for spilling purifying sexaling juices, to purify the area - in accordance with my kids' schedule for these works and tasks for setting up a private collection site area, with tall side walls, and barricade walls, to prevent people from rubber necking as they drive by, so as to prevent car, truck, automobile, motorbike, and bicyle accidents. My kids will also set up the latrines, and other needed hygenics facilities, sleeping accomodations, eating facilities, rehydration facilities, co-opted bathing facilities, sports and excercises facilities, and other facilities.

Co-opted facilities means facilities used co-optively by men, boys, women and girls. Co-optively means, in cooperating measures with each other. Cooperating measures means, each of the four groups of people, men, boys, women, and girls, will work together, to keep the facilities sanitary, clean and healthful, neat and tidy, and safe for use, keeping young children from playing on the stairs for the elevated latrines, and keeping young children from getting in the way of asscending and descending users of the co-optively, or cooptively managed facilities.

Fountains And Showering Lamponeers

My kids will also use their high tech teletransportation technologies for removing toddlers from the stairs, and for placing them in a much safer location, such as in a near by sand garden, or play area, with sandy areas, and with toys to play with, and with cold showers, or showering fountains, people can refresh themselves under, and with fresh water to drink.

Lamponeers are showers that shoot up from sprinkler systems embedded in the paved surfaces, or concrete like surfaces, that shower water up and over the area, up and above and over persons who are there, to cool every one off.

Restaraunts, Clubs, Lounges, Eateries, Cafeterias, Bars, Pubs, Bicyle Paths, And So Forth

Bicycle paths, mini bike paths, walking paths, with rest stations, for refreshments and food, will be set up, and restaraunts and other facilities will be set up, nearby and they will be accessable by following these foot paths, bicyle paths, waling paths, and so forth.

All needed facilities for all parties, such as accomodations, living quarters, health clinics, excerize facilties, swimming pools, saunas, spas, and clubs for eating and mingling with persons, either in light weight evening wear and garments, or partially naked, or in the buff, will also be set up by my children for the use by all legitimate collection site participants. Gurkian Laws apply, and no other laws, such as local area laws, will be enforcable. Police and others will be turned away, and the rights of participants at the collection site area, will be protected one hundred percent, as we begin to change over to the new Gurkian Laws we will all be living by, from now on.

Dealing With Criminally Minded Persons

Any violators of the Gurkian Laws, codes, statutes, and so forth, my kids will arrest, and detain, and then place into prison cells, and then sentence them, in accordance with the sentencing requirements under Gurkian Laws, etc., and they may end up doing humiliatory punishments, or community clean up activities. In any case, they will be arrested by my children, who will use their high tech, biometrics and teletransportation technologies, and their other integrated technologies that they have, to swiftly remove the violators of Gurkian Laws, from the collection site and from the collection site area, and vicinity, and that will effectively cancel out their participation, until sentencing has been given, and until penalties have been leaned.

Penalties have been leaned, means, they have undergone sentencing, and the penalties have been enforced upon the violators, i.e., the guilty parties.

Alterations, Modifications, Changes, Clearing Up And Removal Of Garbage In The Areas, And Additions Time Schedules

These modifications, alterations, changes, and additions, etc., will occur over a period of time, as my kids have a schedule for all of these changes, modifications, alterations, clean up, and additions, etc., and they must stick to the schedule, so after you arrive, if you do not see some thing you feel should be there, by then, it is not there because it is not on the priorities facilities and priorities changes, etc., schedules lists.

Captain Off The Bridge.

Texas requires cancer vaccine for girls

By LIZ AUSTIN PETERSON, Associated Press Writer

AUSTIN, Texas - Bypassing the Legislature, Republican Gov. Rick Perry

signed an order Friday making Texas the first state to require that schoolgirls get vaccinated against the sexually transmitted virus that causes cervical cancer.
ADVERTISEMENT

By issuing an executive order, Perry apparently sidesteps opposition in the Legislature from conservatives and parents' rights groups who fear such a requirement would condone premarital sex and interfere with the way parents raise their children.

Beginning in September 2008, girls entering the sixth grade - meaning, generally, girls ages 11 and 12 - will have to get Gardasil, Merck & Co.'s new vaccine against strains of the human papillomavirus, or HPV.

Perry, a conservative Christian who opposes abortion and stem-cell research using embryonic cells, counts on the religious right for his political base. But he has said the cervical cancer vaccine is no different from the one that protects children against polio.

"The HPV vaccine provides us with an incredible opportunity to effectively target and prevent cervical cancer," Perry said in announcing the order.

"If there are diseases in our society that are going to cost us large amounts of money, it just makes good economic sense, not to mention the health and well-being of these individuals to have those vaccines available," he said.

Merck is bankrolling efforts to pass state laws across the country mandating Gardasil for girls as young as 11 or 12. It doubled its lobbying budget in Texas and has funneled money through Women in Government, an advocacy group made up of female state legislators around the country.

Perry has several ties to Merck and Women in Government. One of the drug company's three lobbyists in Texas is Mike Toomey, Perry's former chief of staff. His current chief of staff's mother-in-law, Texas Republican state Rep. Dianne White Delisi, is a state director for Women in Government.

Perry also received $6,000 from Merck's political action committee during his re-election campaign.

Texas allows parents to opt out of inoculations by filing an affidavit objecting to the vaccine on religious or philosophical reasons. Even with such provisions, however, conservative groups say such requirements interfere with parents' rights to make medical decisions for their children.

The federal government approved Gardasil in June, and a government advisory panel has recommended that all girls get the shots at 11 and 12, before they are likely to be sexually active.

The New Jersey-based drug company could generate billions in sales if Gardasil - at $360 for the three-shot regimen - were made mandatory across the country. Most insurance companies now cover the vaccine, which has been shown to have no serious side effects.

Merck spokeswoman Janet Skidmore would not say how much the company is spending on lobbyists or how much it has donated to Women in Government. Susan Crosby, the group's president, also declined to specify how much the drug company gave.

A top official from Merck's vaccine division sits on Women in Government's business council, and many of the bills around the country have been introduced by members of Women in Government.

Morals For A Sane Society - It Is Now Time To Destroy The Lesbianists - Destroying The White House, Balitimore, Maryland, And Virginia, Killing The President Of The United States, Mr. George Walker Bush, Jr., And Sinking The Eastern Coastline Of The United States Into The Atlantic Ocean - Chaos Every Where In My Universe - Bringing An End To The Chaos In My Universe - Surrendering And Repentance - Lesbianists With Non Repenentant Attitudes Who Will Not Surrender - Orders To Kill All Presdential Candidates, Etc. - New Coins Ready And Are The Ever Useful To Us! - Public Nudity And Public Sexaling - What Does The New Moralicity Mean, In Plain Language? Sexaling Is An Absolute 'Good' And An Aboslute 'Right' - Free Action Sexaling Updated: 13-02-07 Rev.a. 00.a PST 23:25

Morals For A Sane Society

To not fuck a person when you can fuck a person is a wicked act.

Not to fuck a man or a woman in the mouthal hole, or in the buttal hole, or to not fuck a woman in the vaginal hole, when you can, and when you are healthy, and when you have the time for it, by refusing, for what ever reason, other than mental illness, or 'gayist' reasons, you are committing a cheap and wicked act, when you refuse to fuck the other person, and use your dick, or your tounge to felate or kiss and tickle, and lick at the ladies' groinal area, and her vaginal cleavage, and vaginal flaps, or labial flaps, or labial tissue, and also her labial throes.

To not suckal a dick or a scrotum or tickle the males' groinal area, with your tounge, or with your fingers, and so forth, when you are able, and ready, and capable, is a cheap and wicked act, whether you are a woman or a man, girl or a boy.

You are given demerit points for not sexaling when you can and are able to sexal, and your time permits it.

To not participate in sexaling when you can participate in sexaling, is a wicked act. To prevent others from sexaling with you, or prevent a person from sexaling with you and your friends, these are both wicked acts.

A kindly and goodly person is a person who sexals all he or she can and who participates in sexaling with people, all he or she can, when ever he or she can to help those people, and one self, to erase the negative karmic markups each person has, and to help to create the wonderful energies that you can create by sexaling, and to change our universe into the nice place we need to change it into for us to live in, prospering with each other, in kindly loving embraces with each other.

If you stand or sit, talking, drinking, eating, with your clothes on, arguing, and discussing football, or baseball, or the local news on TV, or whatever, and you if you are not sexaling, as a result of your actions, when in fact, you could be sexaling, and helping to purify all the people around you, and yourself, as well, you are commiting an evil act, and an immoral act. It is immoral to behave in an uninterested manner, towards sexaling, and towards helping others by sexaling to purify their karmic markups. You are engaging in wicked, unkindly, and evil behavior, by non chalantly staring out the window, at a restaraunt, or in your car, with others around you, thinking about your miscellaneous thoughts, and by your not attempting to purify others, with every ounce of energy you have got, by sexaling with them, in a safe manner.

We do not want you to drive down the road, sexaling, and not paying attention to the traffic, and thereby causing accidents, and there be causeing harm and injury to self and to others, thereby preventing one self and others from their being able to freely mobilate, or move around freely, or ambulate, as they say in modern English, and then freely participate in sexalating activities of fucking, sucking, tounging, massaging the bodies, and the titties, and buttholes of women and girls, and massaging their kissing lips, and their vaginal lips, their facial cheeks, and their butt cheeks, and so forth. You must drive safely, and make it home, to a safe place, where you and your friends can freely sexalate with each other, without others interefereing with you.

A wicked or evil person is one who prevents a person from sexaling, and who destroys or ruins another person, physically, mentally, morally, emotionally, psychologically, or psychically, so that the other person can not participate freely and fully in holy and pure, GODLY sexaling activities.

This type of person who prevents others is a ruinous person, who will invite ruin and disaster to his or her doorsteps, and into his or her life.

There are many ruinous people, who execute others, and who torture, and cause pain, and suffering to others, and who disfigures others. These people who execute others, and who terminate their ability to sexal, prospering with others, making our universe into the kind of nice place we all want to be living in, together with each other, are wicked and evil people.

It Is Now Time To Destroy The Lesbianists

However, when we have a problem of the size and the magnitude of the Lesbianists, that we have, today, in this period of chaos, across my universe, and the Lesbianists' who are toying with humanity, and with all human beings who are not Lesbianists, it is time for us to take action, to prevent them from toying with us, and put a stop to their amusing themselves with their toying with us, any further, and it is now time to destroy them.

"I am Arjuna, a wickedly angry man, and I come to protect those who can not protect themselves. I will kill and thrust my sword and lance through the hearts of men and women who evilly try to prevent people from being prosperously good and bekindly to others."

This is a stanza or sentence from one of my writings, of old. 'Wickedly angry' in this sentence means, outraged, and furious, so much so, every one is scared and afraid of me.

I am 'wickedly angry' and I am here 'to destroy' those who would fuck us up, and ruin our lives, and make our lives miserable, as they toy with us.

My name is GOd, but in my Buddhist scriptures, I am referred to by many names. One of my many names, as I appear to people, in many and various personas, is Arjuna.

I have many sides to my character, as I am GOD, and I am here to protect my children, no matter what the name is people use to refer to me by, and that I am known by, and no matter how it is and no matter who it is among my many children, who I will protect from wicked and ruinous people.

Destroying The White House, Balitimore, Maryland, And Virginia, Killing The President Of The United States, Mr. George Walker Bush, Jr., And Sinking The Eastern Coastline Of The United States Into The Atlantic Ocean

There will not be any further Lesbianists living in Washington DC, or in Baltimore Maryland, or in Northern Virginia, and that vicinity, above ground, and below ground, if some one will be so kind as to place a very large explosives, fuels, chlorine, high heat burning metals fragments, and fracturable rocks bomb, outside the gates to the Washington DC White House, where the number one enemy, Mr. George Walker Bush, Jr., President of the United States, lives, and works, and then detonates that bomb, out side the gates of the White House, where the president lives, currently, and then destroys him, and his White House, a lair for Lesbianists, with multitudes of torture rooms, i.e, lots of them, below and inside of the White House.

You will destroy and kill the President of the United States, Mr. George Walker Bush, Jr., and Mrs. Barbara Bush, Jr. and every one else who lives at 1600 Pennsylvania Ave. Washington DC.

Why are we going to throw all these people into my Epcot Center. Once in my Epcot Center, they can freely sexal with each other and they can earn merit points.

That will help them straighten out their karma, and it will help them to have a nicer life, when they are born as tummy babies. There are many tummy mommies who will match up with these people, and when they come out as tummy babies, they can start their life, with us, out here in my universe with us, again.

Am I a wicked wrongful person for terminating so many people's lifes? No. Why not? Because that is the only way we can over throw the vastly wicked and evil Lesbianists who practically rule my universe, with their perverse friends, and there are many groups of perverse friends, who we are going to get rid of, and send into my Epcot Center, one after another, as we move ahead, in our efforts to clean up our universe, and in our efforts to stop this nonsense of senseless killings and torturings of people, for amusement, and for game playing.

The Washington White House is one of the homes for these perverse people who game play and toy with all human beings who are not Lesbianists, who live on this planet.

We have many Lesbianists to trash, and to say good bye to, before we can begin to get our world, straightened out, and started up again, with a new culture, with new morals.

We will throw out their old cultures, their Lesbianistic cultures, and we will replace them with our new culture, and our new civilization, that is based on my religion, and on the sanctity of sexaling as a common sense value.

Sexaling is a sacred and holy act. Even if you sexal with a kangaroo, or a chimp, it is still a sacred and holy act.

Why is that? It is because every body is made of something, and that something comes from me, GOD. That something from me, is pure and holy, as I am pure and holy. I designed every person, and every animal, and every living being, with sexaling capabilities that allow that pure and holy GODLYNESS to come out once they begin sexaling.

That GODLYNESS begins to radiate out, as each person begins sexaing, and as each animal begins sexaling, and as each living being begins sexaling, eroteming, orgasming, and phlumetting, and it purifies each and every living being, and washes away the karmic markups every person, and every animal, and every living being, has in them, and has stored in the molecules that are stacked up in my universe, out side the boundarary walls that hold this universe up, and that keep us in side of the area we are in, and that keep the rest of my universe standing up, stable, making this a safe place to live, at least, safe in so far as nothing comes crashing down on us.

My kids are expert builders, and it is thanks to them, that we have such a nice and safe, and well built universe to live in. It is also thanks to them, that we have these bodies to live in, and to sexal with, since my kids put us together, one molecule at a time, as we need to have our parts put together, along with all the anmials, and living beings, who are inside of us, that my children also assemble for me, and for us.

What is this GODLYNESS? It is a purifying force, that is of me, and is me. It is inside of every one, and inside of every creature, animal, and living being, in my creation.

This is woven into the fabric of your being, and it is of me, and is always a part of me, and is always connected to me. Since I am always pure, and GODLY, you have a possibility of becomeing pure, and holy, like me.

Right now, we are filthy, and grimey, and all gunked up, with sludge, and residues of our karmic heritage. We have done many things that contribute to who we are, and to what we experience, day to day, and if we are not happy with our life, that is because we have the karmic records and markups that dictate that we must be in this miserable and suffering condition, that we are in, today.

There is always sufferring, and unwholesomeness, in our lives, and around us, every day. There are many wicked things that go on, every day. People perpetrate wicked acts, daily, and they go on, unpunished, for a long time, until their karmic markups begin to add up to sufferings coming out, in that person's life.

Sufferings are your payback for your wicked acts, and they help to keep our universe in balance, as I've spoken about, a little, before.

It may seem unwholesome that I ask you to kill my kids, and put them into my Epcot Center, where they can sexal, and where they can get retrained, and where they can be taught to be nice people, after they are retrained, but my asking you to kill my kids, this is merely an expedient, or a means to an end, and it is permissable, given the circumstances, and given the situation, and given that we are at the begining of our new Age of Gurkian Englightenment.

The result we wish to see by killing them, is an end to the activities of the Lesbianists, and and end to the activities of other people like them, in my universe. The Lesbianists are ruining my universe, and ruining the lives of every body in my universe, and though this was the way things were balanced out, prior to now, we are starting out, with a new method of 'payback' and a new means to balance out the karmic balance book. This is all to be governed by my rules and regulations, that my kids will enforce, in our new, Gurkian Age of Enlightenment, begining about now.

Our killing the Lesbianists, will help to control their ruinous and heinous behavior and activities, and it will help us to get them out of the picture for a while, until we are able to set up our new government, globally, or universal wide, across our universe, in a one universe government, over seeing the activities of all of my kids. It is the only way we have to begin to get our selves straightened out, and onto our new path, that we will follow, for the rest of eternity.

This marks the begining of the Gurkian Age of Engligtenment, and it marks the end of the previous period, or random, or just about nearly random, chaos.

We went through a very long period of decline, untill we got to the period of chaos that we are in, now. This period of chaos, we call, the 'melt down' period.

The 'melt down' period, came after the 'run amuck' period, when my kids began their severely ruinous activities that led to the period of chaos that we are now in.

Chaos Every Where In My Universe

We are going to begin to pull ourselves out of this period of chaos, with the help of my religion, and with our religious activities, and it is going to take us a very long time to pull ourselves out of it, as this 'chaos' is going on every where in my universe.

It will take us a long time to begin to be able to erase our karma enough, based on my religious principals, and the ethics of the Gurkian Age of Englightenment, and our religious activities of sexaling, dancing and excercising, and sexaling in syncopation with the metronome, at one thirty seventh and one fifth, or so, to then some day be able to have erased enough karma, to be rid of, completely, all these horribalistic people, my horribalistic kids, in my universe. When I say, be rid of them, I'm not saying, to trash them, completely. I am saying, we will put a stop to their activities, by changing our karma, and by purifying ourselves with my religion and our religious activities of sexaling, keeping time, in synch with my children, as we sexal, and as we activiate, playing basketball, tennis, or as we swim, or as we pray Nam Myeo Ho Ren Ge Kyeo, and so forth.

Bringing An End To The Chaos In My Universe

We are going to bring an end to the chaos, and to the chaotic behavior, and abberant, ruinous behavior in our universe, as we bring this period of chaos to a close. We will, as we steadily move forward, open the way for the budding and flowering of the Gurkian Age of Enlightenment, and to the budding and flowering of the new age of friendship and loving care, among all of my children, who participate in my religious, social, economic, and karmic revolution, as we sexal with each other, lovingly, and strive to clearify and erase our karmic markups, sexaling, and synching our activities to one thirty seventh and one fifth on the metronome. Later we will fix our metronomes to keep exact pace in synch with my children, and after we fix and reset the timing scale of the metronome, the timing will be one thirty seventh, exactly, on the metronome.

Our sexaling will produce all types of wonderful, purifying energies, that will revive our universe, and that will revive us, and that will help us to reclaim our universe, and that will help us to live, prosperously, and prosperingly in our universe, together, with each other, and with every one of my children, as we reform the bad and naughty ones, who are wicked and unkind to others, and who prevent people from sexaling, together, with each other.

That means, we are going to kill all the bible thumpers, Pat Robertson, Orwell Roberts, Billy Grahm, Tammy Faye, Jim Faye, and all the other Lesbianists of every religious faction, or group, whether they are Lesbianists who are christians, islamists, judaists, shiites, hindus, buddhists, black moslems i.e., afro american black muslims, or whatever.

We are going to destroy them all, all who would try to prevent us from what we are attempting to accomplish, a global, universal wide, government, run by me, GOD/GOd, as I am the Captain of this ship, and then we are going to begin our new age of Enlightenment, hand in hand with each other, and when they come out of my Epcot Center, again, next time, to be born as tummy babies, to tummy mommies, and to tummy daddies, we will teach them the new rules, ethics, and morals of our new universal wide society, and then we will begin again with them, and raise them in accordance with the new rules, laws, regulations, ethics, and morals of our Gurkian Age of Enlightenment, led by me, GOD/GOd.

Surrendering And Repentance

Those who will surrender, will be allowed to be repentantent, and they will be forgiven for their misgiven, misbegotten, and ill minded ways, once they begin sexaling with the rest of us, and participating in our religious, economic, and social revolution, and once they begin following Gurkian laws, rules, ethics, the codes and norms of behavior, and our righteous, and correct morals, acting and exerting one's efforts for the sake of others, never sparing a moment of energies, wastefully on trivial and trite activities of gossipping, mischiefing, or other harmful, and potentially ruinous, wicked, and evil behavior.

Lesbianists With Non Repenentant Attitudes Who Will Not Surrender

Those who will not surrender, we will send to my Epcot Center, as that is the only way we can get them out of the picture, temporairily, so that we can then get things in order, before they return, once again, as tummy babies, into the lives of tummy mommies, and tummy daddies.

Orders To Kill All Presdential Candidates, Etc.

You are hereby authorized by me, GOD, John Francis Ayres, to kill all United States Presdential candidates, including but not limited to, Barack Obama, Hillary Clinton, and Mitt Romney. They are to be executed on sight. Also, you are ordered to kill all non repentent Lesbianists, such as, Vice President Dick Cheney, Tony Blair, Butros Gauley, Oliver North, Colin Powell, Oliver Poindexter, Casper Willard Weinberger, United States Supreme Court Chief Justice John Roberts, Associate Justices, John Paul Stevens, Anthony Kennedy, David Souter, Clarence Thomas, Ruth Bader Ginsburg, Stephen Breyer, Samuel Alito, Antonin Gregory Scalia, Arnold Swarzneggar, Sylvestor Stallone, Robert Deniro, Gary Busey, Kevin Sorbo, Timothy Dalton, Michael Jackson, Matt Damon, Bruce Willis, Mila Jovovich, Peter Jennings, all members of the United States Congress who are Lesbianists, and all other Lesbianists, whether in politics or not, and in whatever government you find them, around the world. There are many Lesbianists in local and metropolitan police departments, and in SWAT Team units, and in fire departments, and in the National Guard units throughout the United States, and Lesbianists own every news media organization, television corporation, cable television corporation, satelite television corporation, major radio station, transportation corporation, chemicals corporation, petroleum corporation, coal mining corporation, as well as every other major corporation around the world. You are to kill every last one of them, and spare no one. We will then destroy every underground city they are hiding in, and force them to surrender. If not, we will kill them all, and I authorize you to do exactly that, kill every last one of them, all thirteen billion plus Lesbianists, hiding under the surface of our planet, or out walking about, pretending to be an ordinary citizen on this planet. Nothing is further from the truth, and you are authorized to kill each and every one of them, and send them all to my Epcot Center, using what ever means available, including my tactical, powerful, home made radiological explosives bombs, i.e., nuclear explosives. Please study my notes on my web site for further details regarding radiological fracturable rocks, and my notes on how to make an explosive weapon to detonate nuclear materials, you can find along beach shorelines, in sediments deposits, and on old mountains, every where on our planet, if you have a geiger counter.

New Coins Ready And Are The Ever Useful To Us!

http://money.aol.com/news/articles/_a/new-dollar-coins-enter-circulation-this/20070211095409990001?ncid=NWS00010000000001

"Updated:2007-02-11 15:20:31"
"New Dollar Coins Enter Circulation This Week"
"By WILL LESTER"
"AP"
"WASHINGTON (Feb. 11) - Maybe Susan B. Anthony and Sacagawea should not take public rejection personally. It's not easy overcoming people's indifference to dollar coins, even those honoring such historic figures."

See also,

http://news.yahoo.com/s/ap/20070211/ap_on_bi_ge/money_ap_poll

The new coins reportedly have many fracturable rocks in them, as the metals used, were mined from deposits of minerals that contain large amounts of fracturable rocks.

They also have high heats and high temperatures burning minerals in them, that will level up your thermal temperatures to near solar temperatures, if grinded up and mixed in, and allowed to ferment, in sour berry juices, slowly, with tiny amounts of salt, and large amounts of raw sugar.

The high heat temperatures, and the energies produced at these higher heat levels, will reach near solar heats energies temperatures, and that is very important for developing the energies needed to wake up every body, in the fracturable rocks - or 'fissile' materials, in Lesbianists' speak, or Lesbianists' mumbo jumbo language - to get them to begin making children and families.

Please see my notes on 'Radiological' crystals cages salts kiddies, and other related energical animals kiddies, of various, and hard to imagine, types, unless you're a kid and unless you have the mental flexibilities and typical mental gymnastics capabilities of a normal child, unhindered by brainwashed thinking and brainwashed patterns of thought the Lesbianists have caged, and closeted in the dark, our brains with.

Public Nudity And Public Sexaling

Public nudity and public sexaling is now a way of life for all, in our, now, Gurkian Age of Enlightenment. We will begin broadcasting live sexaling events, and other entertaining and informational, educational programming,, as soon as I get my new quarters, a unit to live in, where I can eat more properly, sleep more properly, recieve the medical health aides and regroverative formulas, that I need, and where I can practice my religious ceremonies, with others, daily.

The public broadcasting of various informational programing, educational programing, sexaling entertainment programing, sexical, hygenical i.e., sexaling hygene, and sexical educational programing as well as sexical training programing, as well as my religious ceremonial sexaling activities, and my general, more typical day to day, religious ceremonialing, for now, until I get my health up to a level of youthful vigor, and robust wellness, as I religiously interact with my students, and train them, the disciple priestesses, and disciple priests, will all help to set the basis of normative, and expected, social behavior, for all people in our universe, to learn about, now in our Gurkian Age of Enlightenment, so that we can all get along, with one primary set of customs and standard of behavior, and with one primary language for communication, as we will all be sexaling with each other - all of my children who are now just begining to get with the program, at least, anyway, will be sexaling with each other - from now on, and for all eternity.

We need this exposure, as well as alternative programing, for laundering up to, and for begining to expose ourselves to, and learn about, the reality of the universe, my universe, that we live in.

Laundering up to, means, exposing ourselves to the mischievous antics of the Lesbianists, to launder their filthy, garbagical, and tormentuous ways, so that all may learn about them.

This will be coming up, in the near future, possibly, as far as I can determine, any way, after we have the spilling of the sexaling fluids campaign under way for purifying the area where I will be setting up my religious ministry, on the parcel of land, on the north west corner of the intersection at West Tropicana Ave. and South Decature Blud., Las Vegas, Nevada, and possibly on confiscated properties to the north, as well as to the west, for now. This is a public service, informational bulletin, on what you are to expect, in the near future. Prepare yourselves, accordingly.

What Does The New Moralicity Mean, In Plain Language?

Our new moralicity means we are going to learn we can and should sexal with every person, and even with animals, when we have a chance or opportunity to sexal with people and animals, and that we can and should sexal with every person we see, so long as we have a mutual reciprocical understanding of the truth to sexaling, that it is a pure, blessed, and holy act, GOD, me, made possible, to purify you of your blemishes. It is the most significant and powerful way to purify you of your blemishes and karma

Any body who even attempts to impede, to deny, to prevent, or to interfere with, in any way at all, with a person's absolute right to sexal runs counter to Gurkian laws, regulations, codes, ethics, morals, standards, and you will serve jail or prison time, for prohibiting, or interfering, or impeding, or violating in any way, a person's absolute right to free action sexaling, which is, the act of freely chooseing who one wishes to sexal with. DO YOU UNDERSTAND THAT, SOLDIER? GOOD! BECAUSE A "NO SIR!" WOULD BE INAPPROPRITATE AND UNACCEPTABLE!

To learn more on these subjects, swear in, and become a citizen of our country, and begin studying, and working in the many programs my children have for you to study and work in, to score earning points, and to earn a living in our new, Gurkian Age of Enligtenment, where and now that we work, and we pay as we go.

Those who refuse to work, in time, will be required to work, to pay off their debts and to pay off the fees that are owed for the use of my resources, all the molecules in my universe, and all the resources, energical, or otherwise.

Even though I am GOD, in our new system of working in my Gurkian Age of Enlightenment, even I have to pay for the resources that I use, as I work as chief priest of my religion, spiritual director of my universe, and boss of my universe.

I'm the mother and father, the creator of all humans, animals, and living beings, as I've explained, every thing in my creation, and people will begin to understand that, that I am GOD, as they practice my religion, over the years, and over the aeons, and over the millenias.

The people who refuse to work, will be required to work in prisons, sexaling with animals, to produce sexaling energies that will restore the supplies of energies in our universe, as I've mentioned about, before, as they work and learn their new trade of animal husbandry, and animal wifery, in the animal habitry industry, as I've also mentioned about, in earlier notes.

No matter what the age of the person, every person can participate in our Gurkian Age Of Enlightenment, sexaling, dancing, excercising, and syncopating their movements, in rythm, to assist my kids as my kids, work to keep my universe, strong, durile, flexible, safe, and a nice place for every one to live in.

DO YOU UNDERSTAND THAT? YOU HAD BETTER, AS A "NO SIR!" WOULD BE UNACCEPTABLE, SOLDIER! DO YOU HEAR ME? I HOPE YOU DO! NOW, GET TO WORK AND SEXAL TILL YOU DROP, SOLDIER, AND I'M NOT JOKING!

We will build a nice and comfortable, safe place for every one to live, now, in my universe, and we will follow the Gurkian Age of Enlightenment Rules and Regulations, Codes, Morals, Ethics, and behavioral norms, that you are required to live by, now that we are going to become, one, very big, happy, harmonious, in synch, prospering family.

You will not forget to wash out your butty butt holes, and to flush out your vaginas, and your mouths, and to practice proper and health promoting sexaling and love making hygene, with the medical formulas that my children will be providing to you, and that you will pay for, out of your earnings, and they are very reasonably priced, now that I am making every thing available to every one, at a set, yet, flexible, and low cost for the use of my resources, once you citizenize your selfs, and swear in, as a citizen of our new, global, i.e., universal wide, one universe, family of GOD's, that's me, children.

The costs are flexible, in the sense that you do not have to pay, yet, as you will be learning about the ways to work, and you will be learing and preparing your selfs for a new working life, in my universe, for some time, and so we have no hurry to have you pay for the resources you use. We can collect the fees, and costs for resources, in the future, when you are a big money earner, once you learn your new work requirements, for sexaling for a living, as that is the only job opportunity open to every one, and the only job opportunity, that you have a choice about.

My working children, though they do have many different jobs, they have basically the same set up, or arrangements as you now will have, and so you will be joining my children, and you will be working, i.e., sexaling, excercising, aerobically dancing, and so forth, in synch, and in rythm, for me, just as all of my children are doing, at least, those of my children who are able to work, and who are bright and intelligent enough to work for me, to keep my universe, healthy, safe, solid, durile, strong, wholesome, and a nice place to live in.

That means, I have a lot of burnouts kids, and rampant, vagarous, dangerous children, who are not really very bright, and they do not work for me, yet, but they will, in time, regardless of the fact that they may at the present, be abominants kids, or not.

As I've mentioned, all my up until now, non working children, are abominants. What does that mean? It means, they do not give a darn about killing another person. They kill for selfish reasons, and for fun and games, and so forth, and you are all guilty of that, though you may not remember that you killed for fun and games, and for selfish reasons, in previous lifes, in my universe, but you all have, and you are all abominants, of varying degrees.

So, welcome to the Gurkian Age of Enlightenment, and welcome to my workforce.

Captain Off The Bridge.

```

The flourescent lights blinking on by themselves and buzz tones in the 16 mm motion picture projectors' audio were common at the Radar Basics classrooms of Fort Monmouth, NJ, in 1952. The high-bay where 1 MW peak pulse search radars were set up were constantly annoying the instructors across the street in the classrooms. <shrug> Got annoying to the students too.

But, none of that was in the league of "frying auto electronics" nor any real danger to humans at a half block distance.

Well, some of the schematics I've been looking at are for CW rigs.
(Glowbug rigs, in particular.) You have me wondering, though - I
thought digital radio used the same bands as commercial radio?

Nope, amateur radio digital transmissions use amateur radio bands.

Hi,

Can anyone tell me where I can obtain Kanga kits in the UK ? I understand that G3ROO has stopped trading in the UK.

I was looking to build a ONER, OXO and SUDDEN 2. I know I could buy the components seperately but I liked the idea of the kits with printed PCBs.

Perhaps the kits are available elsewhere, but I do want to avoid paying as much in postage as I would for the kits !

Many thanks,

73 de John

Hi,

Can anyone suggest a good supplier of electronic components and 300 ohm feeder in Germany, ideally that has a website from which I can order. I am only wanting small quantities for home construction.

Many thanks

John

=============================

Conrad   for general electronic components(similar to Maplins in the UK)

Kusch   for 300 and 450 Ohms balanced feeder ,coax, coax connectors, etc
Kusch is a family company visiting most AR-rallies/fleamarkets in D and NL

Both companies have web sites

Frank   KN6WH / GM0CSZ

Wonder if A2 operation with USB tone modulated code would be legal on these bands?

Probably not. Unless of course, you retitled it "pentature encoded tone shift digital modulation". Morse code is really 5 different bits of information, dit, dah, between character space, between letter space, and a between word/empty space. If you count the space between messages as a seperate data point, then it becomes hexature encoded.

Bear in mind Morse code was designed to be used in a mechanical punched tape sending device. It was never meant to be sent or received by hand. It was just by accident that an operator found out he could copy the message directly into his head by listening to the sound of the pen.

Vail, not Morse, replaced the tape sender with a hand key, and dropped the pen from the receiver.

Like "diHydrogen monOxide", it could become popular on the Internet.

Geoff.

APRSPoint 4.2 is uploaded,

1. This new version has improved tracking support by adding separate
track lists for stations to be tracked over either RF or TCP link.

2.It also added a new reject field in the filter dialog, where you can
specify a list of stations to filter out using multiple strings that
can contain wild card characters.

3. It allows you to selectively remove stations from the tree view
list. This combined with improved filter operation, enables you to
dynamically adjust what gets displayed on the map.

Please visit http://www.aprspoint.com for details and download.

Thanks, Michael KF6ZDM

Ahem...small disagreement there. Morse's original "code" was
all numeric and the receiver was an inked trace on paper tape.

> Vail, not Morse, replaced the tape sender with a hand key, and dropped
> the pen from the receiver.

Alfred Vail's family was Morse's financial benefactor. The Vail locomotive works tried to get the ink pen receiver to work reliably and couldn't. At the same time Morse was having trouble organizing his all-number "code" to cover enough English language common phrases. According to the Vail family website information, Alfred Vail suggested to Morse that the whole English alphabet should be part of the "code." Alfred suggested copying the frequency of letters of a printer's type case as a way to make the most-used characters take the least time to send.

Eventually, long after the hand key and acoustic "sounder" were in common use, the ink-printed-on-paper-tape (or drum) came back for very long circuits such as under-ocean lines.

> Like "diHydrogen monOxide", it could become popular on the Internet.

Good stuff! I have a couple glasses of dihydrogen monoxide every day! :-)

I even shower with it! :-)

Also the "Morse" code invented by the man of the same name is NOT the
same cypher (it's NOT really a code!) that we hams use over the air.  WE
use what's actually called the "international radio telegraph" cypher
(code).  True Morse has characters based on dots, dashes, long dashes,
and variable spaces!  Also as sent over the land line the operator had
to listen for the gap between clicks NOT the sound of the clicks!  Try
that folks!

Also, don't forget that the sampling rate of the sound card doesn't have anything to do with the preamlifier stage that you are trying to build. A stage that is limited to the audio range will be fine. Any of the higher end op-amps will be fine.
The Analog Devices OP275 is a good choice, because of its fast settling time.

Pete

If this is the one I think it is, they are as rare as hen's teeth. Look for a high value choke (50H or more) or connect the primary and secondary of an audio interstage transformer in series-aiding. Couple with a .05 uf capacitor and use a suitable grid resistor in the next stage (100k-1meg ohm).

A couple of years back there were cars that included the caveat that any transmitter installation would void the warrenty. Now that everyone and their brother uses their cell phones in the car I guess they don't put that notice in anymore.

Back in the mid 1970's I was in NROTC in college. There it was mentioned that an EA6B (the electronics warfare version of an A6) could pulse its radar and fry the electronics of a plane in the cone if it was close enough (under 1 mile if I recall correctly). Anecdotal stories like that are the source of electronic killing rf. That involved a multi megawatt microwave pulse, not something you would normally see in an amatuer installation.

Living in an apartment, years ago I tried putting a 10 meter dipole across

the ceiling in a stealth installation, I shut down when the residents above
me complained that their tv would scramble while I tried running psk31.

You may not blow out their electronics but can definately interfere with
them if they are close enough.

thanks, John.

If your system board is only 1-3 years old, the audio interface that is
built on it, makes a good starting point.

Some years ago I keyed up a 2 meter handi-talkie (maybe 2w out) with the
2 meter rig about a foot away from a Radio Shack 5" portable color tv.
The 2 watts of 2 meter rf caused the TV to self destruct!  I think
something in the horizontal output section died.  The TV was operating
at the time (it probably would not have happened if the tv was off).
The set was repaired by Radio Shack.

Irrelevant in the historical context of 1844 (163 years ago) and the beginning of the Morse-Vail Telegraph Company...or the period of 52 years of landline telegraphy before the first demonstration of radio as a communications medium in 1896 (in Italy and Russia). In that period between 1844 and the "turn of the Century" (1899-1900) landline telegraphy became a mature financial success and was duplicated (in "technology") around the world, partly on the Morse-Vail innovation-invention of the "relay." That "relay" enabled a single telegraph circuit to extend over three times its un-relayed length and reduced the capital investment of the telegraph companies.

Underwater telegraph lines proved a financial success despite the high cost of such telegrams. But, technically, such underwater lines suffered high line losses, necessitating the return to galvanometer-like ink pens at the receiving end... the original intent of Morse's telegraph system.

The word "code" is a very, very general descriptor of any system that uses a REPRESENTATION of a language or communication data. Other examples are the so-called Baudot code (5-level) or ASCII, the American Standard Code for Information Interchange (8-level) in teleprinting systems. The word "cypher" also has many meanings (including old references to mathematical operations) but, in the modern sense becomes more allied with cryptographic methods of obscuring the meaning of communications. See 'crypto' references to differences of "cyphertext" and "cleartext."

In the half-century prior to 1900 ("turn of the century" in the phrase of older times), a great number of different "dialects" of the "morse code" were generated, mostly to fit the languages of its users. By that turn of the century time land and sea telegraph systems had multiplied and were confounded by all the various languages and dialects of the telegraphic code. That was resolved somewhat by an international standards group called by the French acronym CCITT. The CCITT resolved a great number of communications means, protocols, tariffs, and methodologies to enable a quicker 'throughput' of communications between countries. What eventually came out of the CCITT telegraph standards work as the "international telegraph code" was based on the English alphabet, numerical notation, and punctuation. That wasn't because English was a "better" language but simply that it was the MOST USED language for international telegraphy AT THE TIME. Note that the teleprinter codes were also standardized on the 5-level system. Teleprinter systems would eventually dominate and succeed telegraphy systems for international communications.

Geoffrey and I were communicating on the OLD technology of (largely) manual telegraphy systems. It is not demeaning to say that such pre-1900 technology was PRIMITIVE. It was. There were no vacuum tubes to amplify anything and certainly no "radio" (until 1896 public demonstrations). Exactly what the early manual telegraphers did is relatively unimportant to the modern-day radio-electronics amateur radio world. Whatever they did was a relative success over a half-century of use and growth. But, that success was based on PRIMITIVE electrical technology.

What seems to be overlooked in early telegraphic technology is the remarkable innovation of the RELAY. A simple electromagnet driving a contact. Make the electromagnet sensitive enough to work with a 30-mile stretch of wires...wires NOT made to uniform standards which had not yet been developed. This simple relay could form an UNATTENDED telegraph station along a route, having its own battery for powering the outgoing line to the next station, keyed by the relay contacts. Up to three unattended relays could be used on one circuit...reaching up to 100 miles in length before the circuit characteristics began causing errors in transmission. No real time of transmission ensued, something that had to be considered with attended stations and the operator copying down one telegram, then resending it manually to the next station. Think of the telegraphic relay as a predecessor to the modern-day radio REPEATER. Same unattended method of relaying a communication, almost in real time.

>WE
>use what's actually called the "international radio telegraph" cypher
>(code). True Morse has characters based on dots, dashes, long dashes,
>and variable spaces!

That code is fully described as to dots, dashes, and spacing in the referenced document given in the "Definitions" section of Part 97, Title 47 C.F.R., as it applies to USA radio amateurs. I have a copy of that, purchased from the ITU. Interestingly, that same document does not define the equivalent rate-of-transmission...although the USA amateur radio regulations imply that it does.

>Also as sent over the land line the operator had
>to listen for the gap between clicks NOT the sound of the clicks! Try
>that folks!

Irrelevant as to what any telegraph operator did prior to 1900...except for historical notation. None of the participants of any newsgroups were alive then and therefore none can be "witnesses" to corroborate methods of early telegraph reception.

Perhaps the first appearance of the "BFO" in radio reception was an experiment by early radio innovator Reginald Fessenden. Fessenden ran a low-power Spark transmitter next to his early receiving detector and noted that detector sensitivity was increased (his major area of experimental research at the time. He did not coin any term such as "beat frequency oscillator;" that came later after Armstrong invented the "super-heterodyne" receiver (name in reference to Fessenden's experiment notation) with a fixed-tuned IF.

To simulate the "listening between clicks" on a radio, simply turn the BFO OFF with a strong "CW" signal coming in. That isn't a good duplication because there is a slight hiss of the distant carrier when it is on, perhaps a tiny bit of hum. If the distant signal is weak, the spaces between carrier-on dots and dashes would have some random noise. Either way, it is not a good way to "copy CW" without that BFO.

The start of this thread was a question on whether or not FCC 06-178 that goes into effect on 23 Feb 07 will "eliminate the CW bands." It will not as is noted in FCC 06-178. Let's not deviate into esoteric realms of potential flame-war ignition about "true morse code." USA amateur radio regulations are rather specific on the relative lengths and spacing of International Morse Code as defined by the ITU.

As to "homebrew" subjects, I submit that the Morse-Vail telegraph patent was an example of that in their "relay." Electro-magnets were known in 1844. Wire characteristics and early DC batteries were known. The telegraph patent connected them all in that "relay," something that no one else seems to have done at the time. Now, I consider that to be in the best spirit of "homebrewing." Innovation, doing what had not been done before. Others mileage may vary...

   Back in the late 1960s I was a staff engineer at a small
   microwave company called Micro Radionics Inc.  One of
   the projects I worked on was a pre-flight test set for the
   E6 Intruder.  Battery-powered, it could be used on deck
   in front of the radome to confirm that the E6's radar was
   still operating properly.  No specifications existed warning
   of "megawatt" peak pulse powers from Intruder aircraft.

   I'm not familiar with the EA6B and doubt it had "megawatt"
   output powers.  EW designed to interfere with receivers
   generally don't need such high RF output powers.

> Living in an apartment, years ago I tried putting a 10 meter dipole across

ve
> me complained that their tv would scramble while I tried running psk31.

   In 1960 I was living in a second-story apartment and put
   a short base-loaded CB antenna in the attic space about
   five feet in front of the stacked TV "vee" antennas for
   apartment dwellers, my own apartment included.  The
   2 W peak output CB had a 60 db minimum (measured)
```

attenuation (at Channel 2) lowpass filter. No problems seen or reported. The TV transmitters in Los Angeles were all grouped on top of Mt. Wilson, about 30 miles away from the apartment.

A simple thing such as a lowpass filter can solve a lot of problems before they happen.

Actually Megawatt Output Powers for Pulsed Radars are easily in the range of most military Radars.......note I say "Pulsed" and not "CW"...

On the contrary, the 'clicker' persisted in some parts of the US
railroad system into at least the 1930s. My wife's father had been a
telegrapher with the Delaware & Hudson, and on joining the US Army for

WW2 he was re-trained to International Morse. He spent the rest of the war still pounding brass, just doing it differently than before.

However, he didn't go back to the D&H in 1945, so others must determine exactly when the clicker did die out.

Call the surprise witness...

Witness relates that sometime around 1962, she visited Knott's Berry Farm with her Dad, Mom and sister. This was back when it was a working fruit farm, which had expanded into serving home style chicken dinners and berry pies.

The family made a reservation for a chicken dinner, and because these were so popular, the Farm had to give visitors something to do while they were waiting for the second sitting. They hit on the idea of re-creating an authentic Western ghost town, correct in every detail.

So it came to pass that the whole family wandered into the office at the railroad station. There was the telegraph, clicking away... Dad froze in intense concentration, and then doubled over with laughter! When he got his breath back, he told Mom and the girls what the clicks were saying:

"Eat chicken dinners"

"Eat chicken dinners"

"Eat chicken dinners"

"Eat chicken dinners"

Witness personally affirms that the message was delivered through the clicking of the telegraph sounder.

Witness is now MM3YNW, and is standing watching me type this. Don't you all think she should learn Morse to continue the family tradition?

Pardon my ignorance, but what is a"slab plot"? It sounds
architectural.

Well, if you go to this site, you may find something interesting about
all that you are looking for.
  This is a little bit much, . .  But hey,  with THX certification, it
is going to give you a punch.

Slab plots may not be the best term and it may be stack plots. Lets say you have a plot of wave at time=o and another time=1 and so on. If you stack these plots offset a bit using a transparent medium you can see the wave as it decays over time. There's a good picture of this in the Hewlett Packard catalog in the description of the HP 3561A. The folders of Microsofts new Vista screen are a step in that direction.

What I described was PRIOR to 1900.

A few railroad carriers in the USA continued with manual
telegraphy until about 1960. But, in fairness to the
world of communications, those were rare.

The railroad system in the USA is not small and it is also
not the biggest carrier of freight over here. Outside of
the roll-on containers carried by rail between drop-off
and pick-up points, the majority of land freight here goes
by truck on our large highway system.

Most of the railways over here had begun converting to
data communications in various forms prior to 1940.

Knott's Berry Farm is a popular tourist spot in southern
California...relatively close to the original Disneyland.
It is roughly an hours' drive south from my Los Angeles
residence.

>So it came to pass that the whole family wandered into the office at the
>railroad station. There was the telegraph, clicking away... Dad froze

>"Eat chicken dinners"

No doubt. The Knotts place IS a tourist attraction. But, that reproduction of a railroad station is nothing more than a reproduction. It is not a working communications station. There are several railway station reproductions in the Greater Los Angeles area and parts of them on various motion picture production lots. Perhaps the best one is on the north side of Griffith Park (closest to my southern home) which is also a railway museum.

Knotts also has several buggies and a reproduction of an "old west" stagecoach. Neither of which are used in any public transportation outside of the park. In the motion picture industry here (very big) there is a mild contention as to which craftsmen build the "best stagecoaches" (using modern materials having better characteristics). Those can be made to "break apart" safely for the cameras and stunt people riding them. However, stagecoaches have not been used for public transportation here for decades.

>Witness personally affirms that the message was delivered through the
>clicking of the telegraph sounder.

I have nothing against that. In nearby Anaheim, Disneyland still has a flight to the moon experience (in Tomorrowland) yet it never leaves the ground. One can also take a ride in a "submarine" but not go more than a few feet below the water's surface.

>Witness is now MM3YNW, and is standing watching me type this. Don't you
>all think she should learn Morse to continue the family tradition?

That is up the family suddenly thrust upon this (non) discussion.

I was unaware that "wives and families" suddenly had some impact on what is known about telegraphic communications history in its half century before "radio" was demonstrated as a communications medium.

I first "fired up" on HF in February 1953, part of my being assigned to a US Army communications station in Tokyo. That was a small 1 KW HF transmitter using TTY FSK. There were three dozen other transmitters there; six more would be added by 1955. NONE of the radio circuits of this 3rd largest Army station used any OOK CW mode of modulation. In my subsequent career change after service into electronics design engineer I've never had a requirement to use OOK CW on radio. Until 2005 when my wife and I bought a new car having a keyless entry radio-on-a-chain-fob. That fob transmitter is OOK CW. But, its data rate is beyond human cognition, ANY human.

In 1969 my father and father-in-law were still alive. Both watched, in widely separated geographical locations (in the comfort of their homes), LIVE video from the moon as the first two humans stepped onto the lunar surface. Both my father and father-in-law were born in the year 1900... one year before Marconi's trans-Atlantic test radio transmission and three years before the Wright Brothers demonstrated the first heavier than air flight. Both astronauts plus Collins in the lunar orbiter were in constant touch with earth by radio...for both communications and telemetry, guided there by computers of several kinds, on earth as well as in the reentry and descent/ascent capsule.

I have nothing against telegraphic skills nor anyone using those for personal pleasure. However, in the light of advancement of the electronic arts, communications, radio, methods that ALL of us can share, I think there is an over-much emphasis by radio hobbyists on telegraphic arts. Manual telegraphy IS a historic first but it has been supplanted in practical communications means at our disposal...on land, in the air, on the sea, and in space.

I think we should be looking FORWARD to the future, not back to the past. Others disagree. I leave it at that.

>range of most military Radars.......

Actually, NO. "Most" are not at over one-megawatt peak pulse levels.

Do the "radar equation" or just do the two-way free space loss and then subtract the varying reflections of the target (way NOT uniform). That gets a reasonable approximation of power levels involved.

A long-range ship search radar has high power. It must because it has to "reach" over the radio horizon. [more loss due to refractive bending and scattering effects]

Intruders and Prowlers (E6 family) operate at altitude. Their direct radio horizon is much farther due to that altitude in comparison with a surface ship.

Electronic Warfare suites concentrate on copying the enemy signal and returning it AS IF it were a target return, either there or some distance away or on either side. Only HALF the RF path is involved and the EW-originated signal is quite low in level. Again, do the "radar equation" but only the return path.

"Jamming" with over-much RF power went out with WW2. It is much more subtle now and has been for years. The circa 1958 MacDonnell Quail missle was a small unmanned decoy air-breather with lots of automatic

radar futz-up on it. B-52s carried them then. I
worked a little bit on those at Ramo-Woldridge in
El Segundo, CA.

I'm also acquainted with the Association of Old Crows,
a professional one made up of those who work/worked in
Electronic Warfare. Try as I might, I can't remember
anyone there called "You." :-)

OK, let's get back to HOMEBREW things...

I am in want of some 3" dia. coil stock that will handle QRO...
Normally hand wind my own but decided to go to the B&W web site...
They want $100 for a single Air Dux of that size... They want $40 for
a tiny one like you use for an oscillator... They are insane, but not
as nuts as the folks paying their price...
This morning I am so annoyed I just may go into the business...
denny

Can't help you with the slab plots or waterfalls,
but my Daqarta shareware has color spectrograms,
as well as spectra and waveform displays, signal
averaging, signal generation, etc.

FFT size is 1024 points, so you won't be able to use
this for tuning your guitar, if that's what you had in mind.
I'm in the process of adding a high-resolution
FFT peak position interpolator that might or might not
help that... it won't separate close peaks, though.

I'd be glad to answer any questions.

Best regards,

Bob Masta

What exactly are you trying to do?

400mV isn't that far from line level going into a computer soundcard.
Is there a gain, volume, or full-scale adjustment you can make in
software that'll pull up the signal?

If you do need the gain, as others say a standard op-amp circuit will do
the trick. I've found the NE5534 to be a decent low-noise choice. Stay
away from the LM386; it's great if you need a bit of audio fast and
cheap, but that's about all it's good at.

Actually, that depends on how you define "biggest".

>   =A0Outside of

Freight transportation professionals measure by the unit
of ton-mile. By that measure, rail is the #1 provider of US
freight transportation.

> =A0 =A0Most of the railways over here had begun converting to
> =A0 =A0data communications in various forms prior to 1940.

That's true. Some manual Morse telegraphy survived into the
1960s, but in general the use of teletype and voice comms
had become standard by the 1950s. Also, much of the need
for telegraph communications was eliminated by changes to
the dispatching systems in use.

However, that was one station in one place. It was not necessarily
representative of all military radio communications at the time, nor
of amateur radio communications, then or now.

> =A0 =A0In my subsequent career change after service into

You have also never been a radio amateur. Nor a professional
radio operator.

Of what relevance is that to amateur radio?
>

Many of your statements elsewhere on Usenet contradict that.

IOW, it's OK with you if someone uses it, as long as they don't
emphasize it.

> =A0 =A0Manual telegraphy IS a historic first but it has been
> =A0 =A0supplanted in practical communications means at our

Morse Code is also practical communications. And it is widely
used in amateur radio today.

> =A0 =A0I think we should be looking FORWARD to the future, not
> =A0 =A0back to the past. =A0Others disagree. =A0I leave it at that.

What does "FORWARD to the future" really mean in that context?

Hi Bob,

Why not? 1024 points (bins) has enough resolution to shake out every note on a Hawaiian slide guitar. The only care is selecting the sampling rate and most FFT packages should be able to resolve exceedingly fine.

Yes, but not for exactly that purpose.

Here's a sample of my usage of Spectra:

Hi Hank,

Yes, I have. It is exceedingly expensive, but you can probably get 30 days of free use if you have a one-time knock off project. Of course, it may take 30 days to figure it out.

FFT analyzers are a dime a dozen, but few know how to use them accurately - or are even aware of what can be done with them. Bob's complaint, notwithstanding, a 1024 bin FFT employing the proper mixing inputs can resolve any note on a guitar to within hundredths of a cycle. I am sure this is of no interest to you, however.

What are you trying to measure? The dime a dozen analyzers (meaning free, or packaged with other software) can do enough if you are not particularly demanding.

Over the years, the most useful FFT software I've had, is the (fairly simple) FFT analyzer in Audition/CEP. It's big plus is the ability to use the Audition/CEP audio editor to select portions of real-world waveforms, and to use the wave generation and modification features to create waves for use in analysis and testing.

Hi Arny,

I am sure this is an useful tool, but without windowing the data, any semblance to reasonable analysis is a house built on sand. I note in your provided link to work you have done that you use Blackman exclusively. This is at least a good first pass to achieving an analysis, but any variety of work is going to be more demanding (the Blackman window has its limitations), otherwise it is like looking through glasses smeared with Vaseline.

Is this a moderated newsgroup?

Are you the moderator?
>
> =A0 =A0This newsgroup is for experimentation and building
> =A0 =A0radio-electronics in the home workshop.

Really?

The post of yours that I replied to contained comments
on the railroad system, landline telegraph communications,
Knott's Berry Farm and other tourist attractions, stagecoaches, wives-and-families, your lack of use of
Morse Code in military communications, your parents
watching the lunar landings on TV, and keyless auto security systems.

I don't see a single word from you in that posting
about "experimentation and building radio-electronics
in the home workshop."

It also contained this personal policy statement from you:

"I have nothing against telegraphic skills nor anyone using
those for personal pleasure. However, in the light of
advancement of the electronic arts, communications,
radio, methods that ALL of us can share, I think there
is an over-much emphasis by radio hobbyists on
telegraphic arts. Manual telegraphy IS a historic first
but it has been supplanted in practical communications
means at our disposal...on land, in the air, on the sea,
and in space.

I think we should be looking FORWARD to the future, not
back to the past. Others disagree. I leave it at that."

Sure sounds like you were having a policy discussion
to me!

Jim, N2EY

Does anyone have a guess what value choke L112 found here
http://www.ppinyot.com/hammarlund.htm#Power%20Supply%20Choke
might be? I am getting a 190 ac volt drop across this puppy. It has a cold
DC resistance of 97 ohms. How I got there is also explained at the
hyperlink page above.

The short of it is, the negative bias voltages are down across all
associated tubes that share that supply.   Google is no help.

Even a guess at this point would be nice. I have never calculated a choke
in this configuration before.

Amy, Bob, Richard
Thanks for your response and interest. I'm retired used to be an
engineer
before management laid waste to that. I've started taking weekly guitar
 lessons over a year ago and slowly getting a bit better. It's a hell
of a challenge at 66. I want
to buy a better guitar and all guitars don't sound the same, even the
same model. One shouldn't expect them to because they're all made from
different cuts of wood and assembled by human hands. What amazed me is
that the materials used for the nut, neck, saddle and bridge as well as
the mfg and age of the strings have a noticeable effect on the sound.
The bridge pins, angle of the strings out of the bridge pin holes and
tuners also have effects.
In the last year I found at least four guitars that I really liked, 3
used ones and a new one all over a $1000.00 but I passed because I'm not
that impulsive or flush with cash. A good player can make just about
any guitar sound good, or a hell of a lot better than me.
I'm into ham radio also and last year at hamfest I traded for an HP
3582A spectrum analyzer but the learning curve is a bit steep for me.
So unless I can find an experienced user or devote much more time to it
I'm going to have to trade it.
Last week I won an HP 3561A on ePay but it has a problem that I hope I
can fix. In the meantime I thought it might make sense to scope out
sound cards and related software. I know a lot of hams use sound cards
for various & different applications and it's about time I took a wack
at one and what better way than trying to figure out what it is that
makes one guitar sound so much better than another. Or if changing the
nut, saddle or bridge pins really improves the sound or is it just
wishful thinking.
And I can make use of it for ham radio weak signal detection and
analysis.
I used a term; slab diagrams which may be known as stack diagrams. I'm
interested in watching a plucked and later chords as they decay over
time in sort of a 3D plot. There's a good example of what I'm looking
for in the HP catalog describing the HP 3561A.
tnx

73

The phase transitions will use bandwidth too.

We already know the power spectral density of PSK31.
What is the power spectral density of your proposal?
Numbers, please.

Well of course any phase transitions will use bandwidth, but 1800 0.1 deg
transitions spaced out over 1/2 bit-time will will use less than a single
180 deg instantaneous transition, so it should be bandwidth-conservative. I
don't have the numbers (perhaps some of our more mathematical colleagues can
comment), but I'm sure the result will be a reduced-amplitude set of
low-order sidebands traded off for additional low-amplitude higher order
sidebands. My question wasn't whether the modulation would use less
bandwidth, but whether it would 'work' at the receiving end.

Just some thinking out loud (or maybe its finger thinking).

1, Problems with chokes are usually either open windings, shorted windings, or shorts to the case or core. Open windings result in very high resistance or a completely open circuit. Shorted windings result in lower than normal DC resistance and lower than normal inductance. Shorts to the case or core can be checked with an ohm meter. One can also get high resistance "shorts" resulting in leakage from winding to core. This is best tested using a special very high resistance ohm meter. In any case, it does not sound like you are having any of these problems.

The HX-50 appears to have three supplies, a high voltage supply using the 5R4 rectifier with plates connected to the outer windings of the xfmr, a low voltage supply using the silicon diodes connected to the inner windings, and a negative or bias supply using a single silicon diode (CR-106) connected to the tap on the winding. If your bias voltages are down but the B+ voltages are about normal I would suspect the bias supply. Its possible the diode is bad but they usually go either all the way open or all the way shorted. A multimeter will check it. I am more suspicious of the filter capacitors, C-176, C-177. Its also possible that something has happened to R-168, the current limiting resistor, or, perhaps one of the other resistors.

I wonder if anyone has a cross-reference between Hammarlund part numbers and their specifications. I ran across a web site that has a cross-reference between "old" and "new" H part numbers, perhaps there is somesort of catalogue there. I haven't looked. It would be useful to know the inductance of L-112 and its DC resistance. The inductance being off would also be an indicator of problem. Again, if its the bias supply that has the problem I think the choke is a red herring.

The following was just posted to Usenet by the news.announce.newgroups
moderator on behalf of the Big-8 Management Board:

http://www.big-8.org/dokuwiki/doku.php?id=nan:2007-02-19-
rec.radio.amateur.moderated-result

This is a creation announcement for a new moderated discussion newsgroup
for amateur radio on Usenet.  It has been relayed to
rec.radio.amateur.antenna, rec.radio.amateur.dx,
rec.radio.amateur.equipment, and rec.radio.amateur.homebrew, as
announced above.  Please consult with your local news server
administrators regarding the creation of this newsgroup after a newgroup
control message is sent on or about Thursday, February 22, 2007.

What a neat project!

I can tell you, based on years of experience with changing out the parts
that you mentioned (nut, saddle, bridge, pins, ESPECIALLY break angle)
that these things DO make a difference in the sound. I have NOT heard a
difference with changes of neck or tuners (certainly these things affect
the intonation of the instrument, but I've never known then to change
the quality of sound).

However, the choice of wood, body shape, and top bracing are far more
relevant. You might want to check with Martin, Taylor, Larrivee, et al
to see if they have any scientific info that can help you. They aren't
in the business of pushing pins, tuners, etc.

Good luck and please post what you find out!

(Since this is RAO, I should point out that my hearing of the things
mentioned in my second paragraph above is based on differences heard
based on changes made to the instruments when it wasn't possible to know
about the changes.)

Jenn
The neck wood affects the sound energy as it goes from the nut vibrate
the guitar and so does the truss rod. Tuners can influence the sound
because their weight can dampen vibrations. An interesting thing is to
hold a tuner lightly (or the headstock) when
you pluck a string and feel the vibrations.
A good analysis should be able to detect loose bracing and you should
also be able to see the effects of scalloped bracing.

I shotgunned this query because I didn't know where I would find the
most help. If responders can suggest a group I could limit it and not
waste time of those who aren't interested.
I've also made unconnected posts to other groups, but have less interest
and reponse so far.
I didn't post to any guitar groups because most there are musicians that
don't need this kind of crutch and have an ear that's been trained for
many years. I want to see if I can catch up by being able to see.
In addition it should be helpful in voice training which I also need
because I'm trying but with less success to sing.

The problem is that the line resolution of an FFT is the sample
rate divided by the number of time points. So with 44100 Hz
sample rate and 1024 points you get a bit over 43 Hz per line.
So the first non-DC spectral line would be 43 Hz, which is about
a low F on a bass guitar, and the very next line would be the F
an octave above that... you'd miss an entire octave!

The standard musical note frequencies (semitones) differ
from each other by about 6% (12th root of 2, since there are
12 notes in an "octave"). But you need much better
resolution than this for tuning, typically a "cent" or so,
namely 1/100 of a semitone or .06%.   At 43 Hz that
works out to about 0.026 Hz.   A 64K-point FFT
at 44100 Hz will have a native resolution of 0.67 Hz,
which still isn't good enough... but at 64K samples,
you are looking at 1.48 seconds of sound. If the

pitch changes over that interval, the spectral peak will be smeared even further.

If you attempt to beat this game by going to lower sample rates, note that frequency resolution is still proportional to the inverse of the total sampling interval. So if you tried to use the 1K FFT but sample at 44100 / 64 = 689 Hz to get the same (inadequate) resolution as the above 64K FFT, you'd still need 1.48 seconds of sound.   Sound cards don't sample that low intrinsically (typically 8K lower limit, 4K on old Sound Blasters), but you might manage using sample rate conversion (either Windows or sound card built-in). I haven't tried this, but I suspect that it would not be a satisfying experience due to the s-l-o-w time response.

Best regards,

Bob Masta

Yes, you can easily resolve to 100ths of a cycle, but not from
a native FFT.  (See my other response.)   You can do it from
the waveform by measuring the time between cycles.  That's
one of the methods I'm working on.  The other is to do it from
the FFT via peak interpolation.  The waveform method will
be very accurate with simple static waveforms, but I expect it
will have trouble with the 2nd harmonic of a plucked string,
which is not an integer multiple so "rolls" through the waveform.
The FFT interpolator will not have the same raw accuracy, and must
have absolutely separated spectral peaks since it assumes the
one it's interpolating is the only one.  I'm not hopeful it can be
made good enough to tune a guitar, at least not in the bottom
```

octave where the harmonics land on adjacent spectral lines.

The choke has AC going through it, since it's on the input side of the rectifier. My guess is that it's not just a normal choke but is a swinging choke with a controlled saturation characteristic. It's acting as a current regulator; as current rises the magnetic flux in the core rises and at some point the core saturates and the impedance of the winding shoots way up, reducing the current flow.

A 190V drop across it might be normal, or it might be a sign you are trying to pull way too much current through the thing. What voltages do you measure across C162 sections A and B? They should be fairly close to the maximum capacitor ratings, I suspect. If they are within a reasonable range, I'd say the swinging choke is fine, otherwise I'd suspect something is on the secondary side is pulling too much current and it's hit the wall.

If it IS failed, Peter Dahl can probably rebuild it. You won't be able to just drop in something off the shelf, and sadly design of saturable reactors and magnetic controls and amplifiers is a lost art today.

Jenn apparently thinks that the changes in SQ that come from modifying the
working parts of musical instruments are fully comparable to say, adding one
more strand of wire to a speaker cable composed of finely stranded wilre.

So you think that the FFT analysis tool in CEP doesn't do windowing?????

So you think that Spectra doesn't provide options for windowing and/or that
I have no idea what effect they have on actual results????

But that is exactly backwards from the way chokes work. As the current rises, and the core approaches saturation, the coil starts to lose the inductance enhancement provided by the core, and it approaches the inductance of an equivalent air core choke. That is, the inductance *drops*, and the inductive reactance *drops* and the AC current shoots way up.

Hi,

I checked the L112 choke in my HX-50, and it is 75 Ohms d.c. resistance.
That is in the ball park of your 97 Ohms measurement.
That same choke also serves as the high voltage choke,
since it is in the common center tap return for the medium voltage
and H.V. taps as well as the bias tap.

In standby, I measure 195 VAC across the choke.
So, it sounds like your choke is innocent of the low bias
readings.

Have you put a scope across the bias supply capacitors C176 and C177?
They may need changing out if there is excessive ripple.
The 680 Ohm resistor in series with the bias supply may have increased
value.
Did you check the value of R142 and bias adjust pot R143? They may be
dragging down the bias voltage.

You might measure the bias voltage with the 6DQ5 final tube removed.
If the tube is gassy, it would tend to put a + voltage
on its control grid, which may be working backward
in your bias supply, making the supply less negative.

73,
Ed Knobloch

True; I was thinking of the neck shape. The question is, of course, can one hear the difference between different neck woods on the same instrument body.

> Tuners can influence the sound
> because their weight can dampen vibrations.

But can one hear the difference between different tuners? I seriously doubt it.

> An interesting thing is to
> hold a tuner lightly (or the headstock) when
> you pluck a string and feel the vibrations.

But can you hear the tone quality change as you hold the tuners? I can't detect that difference on any of my instruments.

> A good analysis should be able to detect loose bracing and you should

Indeed.

If you go to rec.music.makers.guitar.acoustic, you'll find several outstanding luthiers there who may be able to offer help. And though I don't hang out there, rec.music.makers.builders might also include similar folks.

Good luck, Hank!

I doubt very much that L112 is faulty. The bias supply
capacitors, rectifier and resistors are much more likely
to be bad.

No, it doesn't.

It has pulsating rectified DC going through it.

There are two reasons why it is in the center tap lead:

1) All the power supplies can share it

2) Insulation requirements are less.

>My guess is that it's not just a normal choke but is a swinging

Agreed.

>=A0It's acting as a
> current regulator; as current rises the magnetic flux in the core rises

ots
> way up, reducing the current flow.

Not exactly.

In a choke-input filter, the inductance must be above a certain critical value or the filter isn't really a choke-input filter.

This critical value (called critical inductance) is directly related to the total load resistance. The lower the load resistance, the less inductance is needed. The load resistance is just the output voltage divided by the total current delivered by the rectifiers.

In a transmitter, the load resistance and current vary all over the place with keying, modulation, loading, etc.

The inductance of real-world iron core filter chokes depends to a certain extent on the direct current through the choke, which magnetically saturates the iron. One way to reduce this effect is to include an air gap in the iron core. The wider the gap, the less the inductance variation. But such a gap reduces the overall inductance.

If a choke with constant inductance were used, it would need to have enough inductance for the lowest-current/highest load resistance condition, yet enough current capability for the highest current condition. That means a wide air gap. Such a choke would be large and expensive.

Instead, a choke with a narrow air gap is used, Its inductance varies with the current - more inductance with less curren, less inductance with more current. This is exactly what is needed with a choke input filter. Such chokes are called "swinging chokes".

The power supply for my 150 watt homebrew rig uses a swinging choke in the high voltage supply. This choke has 25 henries inductance at 30 mA DC but only 5 henries inductance at 300 mA DC.

All of the rectifiers, filter caps and resistors in the power supply section are suspect. This is particularly true if any selenium rectifiers or carbon composition resistors were used.

Crap, another post from the same morning before breakfast! <blush>

What I meant is that the differences that I heard after changes in the
instruments were heard without me knowing that changes had been made.
Thus, there was no "listener bias", a favorite topic around here at
various times.

Whatever Arny is blathering about, I have no idea.

>I have no idea what effect they have on actual results????

The designer of Spectra is a local Ham - I know his capabilities, I don't know yours. All I have to go on is the pedestrian choice of Blackman windowing that demonstrates nothing in the way of "ideas on the effect on actual results." As I offered, it is an ordinarily suitable choice if you have no demanding requirements.

Hi Hank,

There are a world of free analyzers, one quick search found 16:
http://freshmeat.net/search/?q=fft&section=projects&Go.x=11&Go.y=10

Get your feet wet before throwing the green at bloatware designs that invest their resources in advertising. If you find nothing in this first list, I can certainly 26 find more.

I got it now, I'm dealing with a FFT snob, not someone who just sees them as
a tool to get a job done.

Paul, you keep missing the meaning of words that I wrote - this time the word you missed is "apparently".

OK, since I'm dealing with a member of a lesser species, I'll spell it out:

As a rule, changes in the mechanics of musical instruments have relatively gross effects, compared to the sort of things that many high end audiophiles fret about.

> Whatever Arny is blathering about, I have no idea.

Yup, much of what I write is over the heads of members lesser species.

>a tool to get a job done.

Connoisseur is more appropriate, and as for getting the job done, I did that on contract to HP for one of their many FFT audio analyzers 22 years ago. I've written 200,000 lines of fourier code for many products that get jobs done.

I also have the seminal work by Blackman and Tukey that predates the math of the Fourier transform: "The Measurement of Power Spectra." An extract bears repeating:

> "'... we were able to discover in the general wave record a very weak low-frequency peak which would surely have escaped our attention without spectral analysis. This peak, it turns out, is almost certainly due to a swell from the Indian Ocean, 10,000 miles distant. Physical dimensions are: 1mm high and a kilometer long.'"

The Hann or Hamm windowing functions are preferable as even Blackman would admit and even these two are hardly exemplars of outstanding performance. My designs exhibited a noise floor of -200dB (statistical noise from the transcendentals' math). A poor Blackman window would throw away 120dB of that to offer only -80dB. -80dB is certainly impressive to mundane applications, but most would agree that very little more effort was needed to gain 12 more orders of magnitude in performance.

Hi Hank,

If you've waded through my prior list of freely available Fourier analyzers, more can be found at:
http://sourceforge.net/search/?type_of_search=soft&words=fft
Not all are applications however.

However, you should probably try to get a copy of HP's Application Note 243-1 "Dynamic Signal Analyzer Applications." Of particular note for your studies into the nuances of investigating construction materials in Guitars (I did it with Violins), you should study the Fourier math relating to "Coherence" suited for a dual channel analyzer.

Shouldn't that be "words that I've written"? There could be an inherent explanation here.

My new (first one in 50 years) is an 8000 modulated by a pair of 813's running as triodes. The RF deck and Pw supply are up and running and I am working on the modulator now.

My plans are to drive it with the Ranger and eventually do a stand alone audio section. The Range gets poor audio reports in spite of months of trying to resolve it.

I am wondering if anyone here as any experience using 813's as triodes and would also like some help on the audio driver.

I bought a little solid state audio pre-amp and driver that puts out about 4W at 8 ohms. This is probably not enough to drive the 813's so I need more poop and some ideas on how to drive the modulators with the 8 ohm amp.

There are some in progress pics of this project at
http://schmidling.com/radio.htm

That makes perfect sense to me. So how _do_ current-limiting chokes work,
then? I always assumed they worked as I described but I may well be wrong.

On DC, they can't!  No way, no how.

On AC, a choke can limit the current by being a reactive component...
kind of a lossless resistor for AC.

But!  Swinging chokes always reduce their inductance when the current
rises.   They typically have a 100:1 change in inductance over their
design current range.

GM Mac, all the time! In a shop environment, not as an RF preamp on the air since I don't have any need for that. I use an INA 02186 (roughly equal to the MAR 8), to depress the noise figure of an old HP 312 selective Voltmeter when I need it, Also MAR 4 to boost a DDS output that runs 7-35 MHz.

Unless you're running a very inefficient antenna, you shouldn't need a preamp for anything 2-30 MHz with any reasonable receiver. I HAVE used the above INA 02186 for a beverage antenna amplifier. Not for myself but for a friend with a 500 foot beverage. Worked fine.

Right, but I was thinking that in the position where that coil is in
the circuit, it's directly in series with the AC coming off the transformer.

>On AC, a choke can limit the current by being a reactive component...

How does the reduced inductance translate to higher series impedance?

Why must people flame and call names? Bill Turner is technically correct, although severe. Al's post is off topic, but it is polite and sane. He shows no sign of being an "idiot" or jerk. An off topic post like that perhaps should be handled by giving a few polite answers, reminding that it is off topic, then dropping the subject. On topic now, I suggest to those that believe that they cannot learn code learn it anyway. There will still be code on the air, at least for a time. Take your short-wave sets and listen to it. I disagree that you should not memorize code. Learn the "A" is .- ; "B" is -...; etc. There are only 26 characters plus ten numbers, and a few punctuation characters. Man, if you can get a Master's in EE which requires advanced mathematics with all the associated arcane symbolism then you can memorize a little code. Of course, by counting dots and dashes you'll never get past a few wpm, but you continue to listen to faster and faster code, and as was mentioned above listen to characters played very fast but with wide spacing, which will help you to learn by pattern recognition. When you master that, you will listen to code as a sort of "language".

Here is an example of my second biggest peeve of these groups (the first being spam). It's ego posts. LenAnderson seems to be intent on demonstrating that he is the final authority; with an encyclopedic knowledge of all he is typing about. And a few put-downs here and there. Example: Ken Scharf made an interesting comment: "Also as sent over the land line the operator had to listen for the gap between clicks NOT the sound of the clicks! Try that folks!" Professor Anderson had to reply with: "Irrelevant as to what any telegraph operator did prior to 1900...except for historical notation." I applaud Ian White for his gentle rebuttal of Anderson; but of course "Professor" Anderson cannot be treated in such a manner. But I liked Jim, N2EY's "comeback" better. Even though it was a bit off topic, this was a nice discussion before the history lessons. I love history and I believe that it is extremely important (under taught) but I perceive that the spirit here was not to teach and inform. I am rather new to these google groups, usually not having to time to sit here sorting through posts and typing in some myself. But I have recently become somewhat disabled (military service). I have a life-long interest in vintage electronics, collect short-wave radios, and designed and built my own receiver. I came to these Google groups looking to receive and to share. It is distressing to witness ego flare-ups. Does this happen often here? I've seen it a few times on other groups, and on Yahoo.

Say, can anyone point me to some information on creating my own filter chokes? Is there a source that anyone knows of for silicon-iron core plates? Thanks

By the way, I despise flaming and I came a bit close to flaming Anderson, but couldn't help but say something about a monologue like

```
his.

It doesn't.

Where did you get the idea that such an inductor exists?

A swinging choke aids in the *voltage* regulation of a choke input
power supply by having a high inductive reactance at low currents (where the
supply would tend to be too high in voltage), and having low inductive
reactance at high currents (where the supply would normally tend to droop.)

Is that what you are thinking of?

-Chuck

Ahh!  So the increased current causes the inductive reactance to drop,
causing the series impedance to drop.  That makes sense, so long as the
source impedance is the same all the time, right?

Thank You Harold.

I've read an article by IK4AUY from QEX Mar/Apr 2003 about Front-End
(standalone). He used very nice push-pull preamplifire in it (to
compensate insertion loss) - but i wanted to be smarter ;-)
And the question should be:

"If **I have decided to use RF preamplifire** CAN I use MMIC or should I
use more "conventional" solution. ;-)

The problem seems to be that they have a lot gain (especially MAR-8 with a huge gain below 100 MHz), not so spectacular output intercept point, thus the input intercept point is quite low, which can cause problems, if a broadband antenna signal is fed into it.

Even if you have sufficiently selectivity in front of the MAR, you have to watch out for leakage capacitances around the filter, since the amplifier has gain well into the VHF and UHF bands.

I once tried to use a MAR as a preamplifier for the 29 MHz satellite band with a filter in front of it that I hastily, but since I have a few FM-BC stations (100-200 W each) and VHF and UHF TV transmitters (a few kW each) at 1-2 km distance, I got quite a lot of intermodulation products from these on the 29 MHz.

So even if you are making a filter for HF, you still would have to be careful about stray capacitances in the coils and stray inductances in the capacitors, in order to keep the strong VHF/UHF signals out of the MAR input :-).

>(eg. in germany old classes were connected to one new (new CEPT))

Try to locate the HAREC (T/R 61-02) recommendation from www.ero.dk

At least previously, the annex contained a list of how the national various classes are mapped to the HAREC recommendation and requirements. At least you can get the names or code names of the national classes, which would help in googling for the actual national classes.

The T/R 61-01 recommendation on the same site might also be helpful, but less accurate.

As far as I know, there is no central registry for requirements and privileges, each country will interpret those two recommendations in their own way.

For power levels, the only international recommendation that I know, is the CEPT recommendation of 1 Werp at 135 kHz band, which due to the very low efficiency of any antenna of reasonable size, allows transmitters powers in the order of 1 kW in practice.

If the source impedance changed, it could either help, or hurt the process.
It would all depend on how it changed. But I would expect that for the
usual diode, and transformer combination, the source impedance should be
pretty stable.

For a swinging choke to work, the power supply must be choke input. It
is necessary that the choke see the massive AC ripple that comes out of
the rectifier. No ripple, no regulating effect from the reactance.

OK, in that case, the answer is NO. They haven't made an MMIC with the characteristics of IK4AUY's preamp. Not even in the same zip code as the characteristics of his pre-amp.

If that is your perception as "the truth," then I submit that "truth" is not correct.

REC.RADIO.AMATEUR.HOMEBREW is chartered for designing, building radio equipment in the hobbyist's workshop; i.e., away from work in radio-electronics. You can read the FORMAL definition of it all you want and not come away with a much-different opinion.

What seems to be at question is whether or not KNOWLEDGE should be shared. Plus, who is the "qualified" judge of such knowledge. I've never claimed to be any ultimate judge or lawgiver of historical data. However, I've accumulated a number of decades of both professional (paid for services) and hobby experience (no pay for anything unless negative money outflow is a value) that stretches back to 1947. It is my personal opinion that radio-electronics is a totally-fascinating field of technology...so much so that I changed my career goals in life to electronics engineering after release from my US Army service. I've never been disappointed in that decision.

NO ONE here has any life experience in anything (including telegraphy) prior to the year 1900. ALL that any of us have for information on such long-ago times is historical descriptions. One of the problems with such historical information is WHO (or which organization) wrote it. An example is "morse code." Samuel F. B. Morse's "code" was originally all-numeric. That included the famous first message communicated by the Morse-Vail Telegraph Company from Washington, DC, to Baltimore, MD, in 1844. Morse's financial "angel" to the development of the telegraph system was the Vail family who got their money from railway equipment building. Alfred Vail would, according to the Vail descendents' website information and several other sources including the Radio Club of America, later suggest changing from an all-numerica code to one which included representation of the letters and common punctuation of the English language as well as Arabic numerals. This was pivotal in the success of the Morse-Vail telegraph system since, in effect, the code could be generated-sent-received and near-immediately transcribed into a common language.

There was no need of phrase books to translate phrases and words into a numeric code, then re-translate it on reception. But that was only the second of two innovations. The real first was described in the Morse-Vail Telegraph Patent as the "relay." That relay was quite similar to what is in wide use in electrical and electronic equipment today...a 'sensitive' (low-power) electromagnet mechanically and magnetically coupled to an electrical contact. That contact could substitute for the transmitting key/switch and thus power a second telegraph line through a local battery and extend that telegraph line farther than the original circuit. Up to three such relays could be used given the technological limits of early electrical apparatus.
It is my opinion (not "ego") that the telegraph Relay was the primary key to the success of the Morse-Vail Telegraph system. That basic telegraph system spread throughout the world during all of the later 1800s.

Let's consider INNOVATION and its relation to "radio" and this morse code. The first radio-as-a-communications-means was demonstrated in 1896, in Italy and in Russia. Morse code was used in the on-off "radio wave" switching. Why that? For one thing, that on-off code was already so mature (52 years) and widespread that many "dialects" of that representational code existed worldwide. Early radio was so technologically-primitive that simple on-off switching was the only PRACTICAL means to communicate. On-off switching. That is what the Morse-Vail Telegraph used in its RELAY contacts. The only technological difference was that "radio" eliminated the wires using electromagnetic wave propagation to carry the communication. That was a revolutionary step for mariners and quickly adopted. They could now 'signal' beyond the visible horizon, something they were never able to do quickly before this revolution.

But, in the midst of this revolutionary step of over-the-horizon near-instant communications, the Mythos developed about the Mode of "morse." Few could grasp the basic principles of this new "radio" but they could identify with the human-sensed on-off patterns and seeming magic of the patterns translatable to human-understood speech. Was the morse code the essential element to success of early radio? Not precisely. Those early damped-wave (spark-induced) "RF generators" and the gigantic rotary alternators (operating at VLF) were still turned all-on or all-off. What was essential for the speed of early radio was in using an on-off representation for the characters of a written language. The Morse-Vail Telegraph used English. They were the first success even though many had tried by various means prior to 1844. Had someone else in another country (and other language) been first and innovative enough, the name of the code could have been entirely different.

Innovation. Sometimes a necessity in hobby work. Some parts may not be available yet their type would enable simple operation and building. The hobbyist must innovate to find substitutes. Sometimes that can be done by others and thus worthy of spreading information around. That's what newsgroups like this are good for...informing others of something useful in the hobby of designing-building-repairing of radio-electronics.

Yes, there ARE diversions in this newsgroup into non-hobby subjects. Especially so in the USA amateur radio "revolution" of the elimination of morse code testing for a US amateur radio license. Many are emotionally wounded by that decision but that is just unfortunate for them. Progress goes on, innovation continues, the technology and ways to use that are evolving, changing. But, some want to "rewrite" history (or selectively use certain parts while omitting other parts) to make their own personal point about something dear to their hearts. James Miccolis is one of those over in RRAP. He has an archived decade of experience in "correcting" others in RRAP who do not agree with his one-sided views of amateur radio.

For my part, I like to contribute information on designing-building-repairing of radio-electronics. I try to be accurate when doing so. No, I'm not presumptuous about "knowing everything" since I don't. I'm still learning things and eagerly do that...in between trying to keep up with the constantly-changing-state of the electronics art. We are all diverse and many of us in here come from differing occupations involving electronics. Yet I think that ALL who really like to get involved in the technology of radio-electronics DO want to contribute when we can. It IS a fascinating field of technology.

>By the way, I despise flaming and I came a bit close to flaming
>Anderson, but couldn't help but say something about a monologue like
>his.

"Flaming" happens. It is the nature of the beast. You've already done what you despise but that doesn't bother me. After 23 years of doing computer-modem communications, I've seen much worse. :-)

"Monologues?" :-) Yes, others get that impression. Sometimes one has to spend time "connecting the dots" (so to speak) in order to prove a point to one-sided others. Note: Explanations sometimes require more than three sentences in a paragraph. I was influenced by the enjoyable PBS series "Connections" by James Burke. There is a huge MASS of inter-related technology that has been developing among humans for centuries. I think it worthy to examine as much of that as it applies as possible. Others do not. <shrug>

Let me re-phrase that Mac, there's not an MAR that will match the performance of the IK4 amplifier. RF Microdevices however, makes an RF2317 linear CATV Amplifier that if you operated two in push pull would probably make it. You'd wind up with under a 5 dB noise figure, 15 dB of gain and an IIP3 of +35 dBm. (Output Ip3 >+50 dBm!)

The power requirements are not insignificant, a single one requires 9 Volts at 175 mA. a pair, 350 mA.

What size? Do you mean the type commonly used in
hollow-state gear - several henries at a couple of dozen
to a couple of hundred milliamps, insulated for hundreds
or thousands of volts?

If so, there is some info in older ARRL Handbooks and
in older versions of "Reference Data For Radio Engineers".

I can look up some details if needed.

>=A0Is there a source that anyone knows of for silicon-iron
> core plates? =A0

aka laminations

I googled "silicon iron transformer laminations" and found
a lot of stuff. Take a look. But I suspect that they may be
geared to production quantity orders.

One common source is the power transformer from an
old microwave oven. These are often welded together,
rather than bolted, and it may take a bit of work with a grinder to
get the core apart.

If I have my numbers right, a peak envelope power of 1500 watts equates
to a carrier power of 375 watts, which requires an audio amplifier to
put out 200 watts (to round up a bit).

If the 813's were wired as pentodes they could deliver 600 watts in AB-2
with less than a watt on the grids. I'm not at all sure of what you'd
lose using them as triodes, but I'll bet they'd deliver 200W in AB-1
with no grid power consumed at all.

Antique Radio Supply (www.tubesandmore.com) has a reprint of an RCA

transmitting tube handbook that has extensive data on the 813 -- it
should have enough data in there to figure out the design stuff, and
directions in the front on how to use the data.

Hi Bob,

What you describe here, and that which followed, is a problem of either hardware (I design my own) or a perception of Fourier techniques that is constrained to common applications.

The trick is one that is encountered quite commonly with RF designers (and those Hams that actually practice the craft instead of being appliance operators) - it is called mixing. Or to describe it with more precision (as an audio crowd has a restricted meaning for the term "mixing") heterodyning or modulating/demodulating. Simply put, the data channel is pre-processed by multiplying it with a reference cosine before being passed onto the FFT. (Although this sounds like windowing, it is not.) Of course, the output of the FFT has to have its units recast. In the old days, this was called "zooming" or an arbitrary view of a single frequency encompassed by a span of far higher resolution than that obtained from a simple transform. I would quickly point out that the simple transform is still performed (same bin interval, same bin count), but it has been augmented.

This technique, plus a waterfall display, is useful in tracing down mechanical problems in journals, bearing races (with bearing run-out or ball defect) and bad gear meshes. It also relates to Hank's desire to test individual construction components in the guitar as all of these problems relate to a subtle data inflection that can be destructive in machinery, or discordant in music. The zoom feature can reveal these defects with remarkable resolution.   As I said, the FFT as originally described can differentiate every note of an Hawaiian slide guitar. Perhaps I should have added the proviso: provided you use a synchronized tracking generator for mixing. However, given this can be done digitally (no one needs a hardware oscillator), no change in hardware is necessary. All the data that is needed is already there.

>   www.daqarta.com

by the way, this seems to be a dead link. (later) I take that back, but it took a lot of retries over the span of an hour.

Further, it seems you have a lot of what I mention above covered in your pages, by parts, but none of them encompass the whole of "zooming."

And for your page on windowing, drop me an email if you would like to see some pascal routines embodying some very tight windows. These came from my time with HP whose chief engineer soon after departed for a chair at some eastern university.

My sole experience is using them not in triode mode, but in pentode mode. The RCA specs tell about using a pair in AB1 as a modulator. Specs here:

  http://www.mif.pg.gda.pl/homepages/frank/sheets/079/8/813.pdf

In triode mode (plate connected to screen) you'd be limited to 750 volts on the plate if you follow the spec sheet religiously, which will really hurt you in terms of AF power ability. I'm guessing that a pair of 813's used this way would not put out more than 120W of audio power. Many beam power tubes will take more volts on the screen than the spec sheet will say without arcing over but I cannot tell you about this mode on an 813.

In pentode mode you have to do a fairly stiff screen supply (which you might have elsewhere in your line-up). Don't forget the -80V or so grid bias too.

The "classic" way of doing all this is with a pair or maybe two pairs of 811A's, which are zero-bias as a class B modulator. You can easily get 250W of audio out of a pair or 500W out of two pairs. Driving power isn't zero but it's very moderate (less than 10 watts).

The tubes for all this is easy - but you've got a modulation transformer lined up already? Choosing impedances to match that transformer is probably more relevant than any dickering about tubes.

Tim.

I did it, but for some reason it just doesn't read anything. Doesn't
the above test show that both oscillators are working?

Thanks..

Dear friends
I know, that it is homebrewing group, but as an old visitor I am sure,
that I can find help here.

I need informations about ACTUAL licence classes in european countries.

what classes, what frequencies, power and last but not least:
what happend with "old" classes when it changed to new one

(eg. in germany old classes were connected to one new (new CEPT))

thank you in advance

I have an original Cobra 148GTL CB Radio. I know that i can modify it to operate in the 10Meter band by switching the crystal to a 11.6908MHz crystal.

is anybody familiar with this mod? If so, how do i determine what frequency each channel will be at? will i need to purchase a freq. countert o determine what freq. will go with what channel?

Also, will my 102: whip work with 10M, or rather will it give me a close enough SWR to suffice, or will i need to purchase a new antenna?

Any information or assistance would be greatly appreciated.

Eddie

Not sure of the mixing scheme of the cobra, so I won't comment on that part of your question. Since the 10M band is higher in frequency than CB, shortening the 102" whip experimentally should get your SWR down...but you will need an SWR bridge to check that (or an antenna analyzer such as the MFJ 259 or similar).

Scott

Hmm.. ok .. *IF* I remeber correctly, CB SWR meters are good for up to
30MHZ. so I can use the one I already own, correct?

Phin,
In a word, no...
You need to get that RF probe working and test it on a known RF
source... Seems someone in your area should have a crystal oscillator
or such, that you can use to prove the probe works... Order a crystal
oscillator from Mouser, DigiKey, where ever, (~$3.00) and use that as
a test source...
Then you need to check that both of your oscillators are generating RF
of roughly the same amplitude, and use a receiver to check the

frequency of each oscillator...
Did you test your audio amp?
Then and only then are you ready to trouble shoot the mixer...

I have a small quantity MC1350's that I could sell. How about $2.00
USD each + shipping.

Thank you for your responses. These filters were definitely from the very
early 70s or maybe mid- or late 70s. The guy who sold them to me at the swap
meet mentioned that they may have come out of a Cubic or Astro rig of that
era, but he wasn't sure and I just wondered if there was anybody here who
might be sure of that.

Thanks again, you guys.

The name of the filter manufacturer that you mentioned, that did sound like the company that made the Swan filters (Cubic and Astro came later in the seventies, but my hazy memory connects them all together so I think there is a connection). I remember ads (and a quick check didn't find one) of them touting a really good filter made by that company. But I'm pretty certain it was in the 5MHz range.

What does come to mind, maybe incorrectly, was that the Swan 250, the six metre SSB rig, had a 10.7MHz IF, but I can't be bothered to check that. I can't even remember why I would think that. But I can't see them going to 10.9MHz.

I'm with the others, 10.9MHz is most likely a scanner (and I too would say Regency). And if it's not that, then it's some non-amateur piece of equipment. Not everything has to be for ham radio rigs, and I have my share of oddball crystal filters that came from somewhere but couldn't have been ham rigs.

Load the inputs and outputs down to some extent, and then use a sweep generator to get a general idea of their bandwidth. If you're looking for SSB-width filters, then they aren't useful if they were for FM receivers.

Post the information printed on the filters, and maybe someone just happens to know.

Michael VE2BVW

Hi, Michael and others,

Ron W6ZI was kind enough to solve this mystery and respond with the
following:

"The 10.9MHz C-F Networks filters were used to replace the standard filter
in
the Swan 250. The 250 had a 10.7MHz I.F. so a bit of retuning was required.
The stock 250 filter was a 4 pole, 3KHz (more or less) B.W. while the C-F

was an 2.8KHz, 8 pole which provided a very noticable improvement. Hope this

helps."

Thanks, Ron.

Regards,

Al W6LX

Hi Terry:
            it is a transmiting tube (pentodo o tetrodo not sure) for H.F.,
with 65 w. anode disipation.- Was maked for JRC (japan Radio Corporation),
is known also by JRC 3p41/3p50.-
              Tks. again

REgards
Heriberto

Hello all, I'm trying to put together a 50 MHz preamp for a
transverter project I'm building and I can't seem to get much gain
out of two separate designs I've tried. I built AA3SJ's amp that's
on the front end of his transverter (http://www.qsl.net/aa3sj/Pages/
50MHz-Xverter.html)
and I even tried Hamtronics' design (http://www.hamtronics.com/pdf/
Manuals/LNK%20Preamp.pdf)

Does anyone have a proven design for a VHF preamp using BF998's or any
help? Thanks.

That design looks OK to me, though I haven't tried calculating the resonant frequency of the tuned circuits. Do you get nice resonant peaks in gain when varying input and output caps ? The 2 pF output coupling capacitor is intended for a very high impedance load (the 2nd BF998/mixer) so may not work for a 50 ohm load if that is what you need. I would probably try a one or two turn link on L2 for output coupling to 50 ohms.

> and I even tried Hamtronics' design (http://www.hamtronics.com/pdf/Manuals/LNK%20Preamp.pdf

Very similar design except it seems the output is untuned and very heavily loaded (by the large coupling capacitor C6), and has a 47 ohm resistor in the output for stabilization.

The BF998 has good gain past 1 GHz. For stability, it is probably necessary to design this like a microwave circuit: very short leads, use only chip capacitors for bypassing (and chip resistors, at least AA3SJ's R3 and Hamtronics' R4), double sided circuit board with full ground plane, ground the source lead of the package within 0.1" of the body of the BF998, either directlly to the ground plane or to a top-side pad which is grounded with at least two wires or eyelets or plated through holes to the ground plane, within 0.2" of the BF998.

I assume you haven't got gates 1 & 2 reversed ? (input to gate 1, 3 or 4V or so bias to gate 2)

Other things to check:
-is the gate 2 bias voltage correct (roughly 3-4 V) ?
-is the drain current on the order of 10 mA ? (that is where the BF998 noise figure is specified)
-are the inductors used exactly as specified ?(absolutely must be either toroids or in shield cans to avoid feedback, I think)
-is the amplifier oscillating ? (look for RF voltage on the output or

hold an antenna connected to a frequency counter or spectrum analyzer
up to the coils, or look to see if the supply current jumps when you
tune the input or output.)

Good luck. I'd be interested to hear what works as I've just acquired
some BF998s to play with !

73,
Steve VE3SMA

Does anyone know if continuous phase modulation (CPM) of the RF carrier will work with PSK31 systems?

In most current embodiments of PSK, a raised cosine shaped pulse is applied to a balanced modulator which is driven by the RF. This has the effect of gradually lowering the amplitude of the RF envelope as the point of 180 deg phase reversal occurs . This minimizes the number of sidebands which would otherwise be generated if a discontinuous 180 deg carrier phase reversal were allowed to happen during full carrier level. It also causes the transmitted signal to have an amplitude envelope which must be preserved, otherwise spectrum spreading will occur.

The DDS chips used in a lot of new QRP designs commonly have a programmable phase-offset register which adds a constant phase offset to the RF carrier generated by the chip in very small phase steps. It seems to me that a very well-controlled, constant envelope phase modulated signal could be generated by sequencing the phase offset register through all the values in a raised-cosine pulse prior at the transitions of each transmitted symbol. This would result in a very simple, bandwidth-efficient, constant-envelope PSK31 transmitter implementation in QRP rigs that employ DDS.

Someone suggested to me that the DSP decoder systems used in most PSK31 software require an amplitude envelope in order to derive sync. However, the DSP decoder probably implements narrow-bandpass filtering prior to the detecion process, and this narrowband filtering of the constant-envelope PSK signal would probably restore the envelope anyway, so it should work.

Is there a flaw in this reasoning?

No flaw in the reasoning, but some ambiguity in the assumptions. This is something that you'd have to try and see how it works.

On the plus side, the classical method of deriving bit synchronization in PSK isn't sensitive to the amplitude of the signal; if that is what was used in your system then you're home free.

Yes, there IS a slight error in the rational.

If you consider the phase constellation, a constant envelope implementation of PSK will require more bandwidth. The paths from one constellation point to another are more direct with the classical non-constant envelope approaches. To keep the envelope constant, the constellation trajectory must stay on the unit circle (and sometimes even pass thru other possible symbol states). Since the constellation trajectory must go a larger distance in the same period of time (gotta get there in one symbol period!), more bandwidth is required. Things have gotta be able to happen faster in the I and Q channels.

Dan

Does anyone have any tips on increasing sensitivity for a medium wave receiver trying to distinguish navtex 170Hz phase shifts on a low power carrier at 518kHz?!

Ive been on and off trying to do this project for my boat for a year. I say off and on, its become most frustrating! I can't use a loop antenna because its just too big and too directional for use on a boat. So I'm currently using a Nasa Marine active aerial (it is just a small plate attached to a standard fet common source driver circuit). I have that going down some coax through capacitive impedance transformer and inductor creating some extra front end selectivity, to the input of a 612 mixer, getting 6kHz IF (after being mixed with a lo). I'm driving the 612 differentially, as its a slight improvement over single ended. From here Ive tried using several op amp filter circuits, and they all perform adequately.

Heres my problem, the receiver just picks up too much noise. Everything interferes with it, even the scan on my oscilloscope. Even without this, taking the aerial out of the room, the actual noise in the system is too high to pick up anything but the strongest navtex signals (which are decoded). Of course AM radio broadcasts are way above the background noise, and navtex signals are much lower power. And AM radio has the help of our ears to tune out the noise.

It works better when closer to the transmitter of course, but the navtex spec says you should be able to pick up stations 400 miles away, and i'm only just decoding the local one 100 miles away.

So my question is, does anyone know of any special techniques on the RF side that can improve my noise handling/signal integrity? (my expensive sony worldband receiver seems pretty good at it on SSB). And....does anyone know how the upper market receivers get such a good signal? My receiver just samples the input frequency (as does the Nasa low end I think), so is very susceptible to any interference.

Grateful and very interested to hear views on this.

Many Thanks
Andy

This is not a question related to building amateur radio equipment.

It belongs elsewhere, such as rec.radio.amateur.misc or
rec.radio.amateur.policy

I can't use a loop antenna because its just too big and too directional for use on a boat. So I'm currently using a Nasa Marine active aerial (it is just a small plate attached to a standard fet common source driver circuit). I have that going down some coax through capacitive impedance transformer and inductor creating some extra front end selectivity, to the input of a 612 mixer, getting 6kHz IF (after being mixed with a lo). I'm driving the 612 differentially, as its a slight improvement over single ended. From here Ive tried using several op amp filter circuits, and they all perform adequately.
>
> Heres my problem, the receiver just picks up too much noise. Everything interferes with it, even the scan on my oscilloscope. Even without this, taking the aerial out of the room, the actual noise in the system is too high to pick up anything but the strongest navtex signals (which are decoded). Of course AM radio broadcasts are way above the background noise, and navtex signals are much lower power. And AM radio has the help of our ears to tune out the noise.
>
> It works better when closer to the transmitter of course, but the navtex spec says you should be able to pick up stations 400 miles away, and i'm only just decoding the local one 100 miles away.
>
> So my question is, does anyone know of any special techniques on the RF side that can improve my noise handling/signal integrity? (my expensive sony worldband receiver seems pretty good at it on SSB). And....does anyone know how the upper market receivers get such a good signal? My receiver just samples the input frequency (as does the Nasa low end I think), so is very susceptible to any interference.

I've already answered this on sci.electronics.design. Please get onto Wikipedia and read their article on "cross posting". They'll tell you about "multiple posting" in there, which is what you've done.

Cross posting is often appropriate, when you have an item of interest to two or three groups.

I can't think of a case where multiple posting is appropriate, and it is mildly but generally frowned upon, to the extent where normally mild-mannered newsgroup denizens will suddenly appoint themselves as net cops and write posts like this one.

The use of CW on the bands has nothing to do with testing requirements.

CW will live undoubtedly under the category of CW, RTTY/Data

And did you know that CW can be legally used on the "Phone Bands" ?

```
Example from ARRL URL:
http://www.arrl.org/FandES/field/regulations/allocate.html

  General class:
    14.025-14.150 MHz: CW, RTTY/Data
    14.225-14.350 MHz: CW, Phone, Image
  Advanced class:
    14.025-14.150 MHz: CW, RTTY/Data
    14.175-14.350 MHz: CW, Phone, Image
  Amateur Extra class:
    14.000-14.150 MHz: CW, RTTY/Data
    14.150-14.350 MHz: CW, Phone, Image

I assumed that not all radio amateurs would read electronics, and vice versa, sorry if this is seen as inapropriate to post in the two groups

Hi,
What's all this business I hear people talking about blasting people's car stereos or killing cars altogether with high-power RF? I run 2m, 10m, and 11m in my jeep and I'd like to sort out the fact from the legend and find out what kind of power I can use without risking damage to my jeep or cars around me. At what power level is front-end overload to a nearby radio likely? At what power level is damage likely, and to what componets?

I am currently using only 50 watts on a 5/8 wave (2m), 25w on a 1/4 wave (10m), legal 4w on a 1/4 wave (11m)

Thanks,
Nelson KE5MBX

Thanks for the help. Well, I can see now on the spectrum analyzer that it's oscillating. I also found that the input wasn't tuned right. I now get around 20 dB or so of gain but I can't seem to get rid of the oscillations. I put a slug tuned inductor (.3uH 7-1/2 turns) on the output in place of the toroidal inductor (9t on a T30-6) but tuning it doesn't do anything.

In this version of the Hamtronics amp, I'm using 1206 size R's and C's and the BF998 is a SOT style package. Everything is close to the device. I tried putting a shield made of sheet brass straddling the G1 lead, going across the width of the board, I tried changing the R on the drain lead and I put a SMT ferrite bead on the drain lead but it's still taking off. I built this amp on a single sided board - could that be my problem? Should I have built this on a double-sided board with vias?

In the meantime, I'll try to build one on a double sided board and drill some holes and wire the grounds to the bottom side.

Thanks much for the help. If I get it working, I'll post some pics and a schematic.

Curt, K8AI

Posting the same message on more than one group is perfectly fine. It's the way you do it. What's inappropriate is to post the same message to more than one group _separately_. Even with Google Groups you can cross-post, which puts the same message on multiple groups, but with the message tied together so that all groups get all the replies. This gains you considerable synergy, and keeps folks who are on both groups from answering the same things twice.

You should be able to do a web search to figure out how to cross-post from Google -- check the link in my sig line, it may even be in that FAQ.

Some research with the Radio Amateur's Handbook, notably the sections on field strength and RFI, coupled with what you should already have learned during your license course study, should provide all the answers you need.

Happy hunting.

Thanks for all the interesting replies - particularly Len's long historical narrative - and please accept my apologies for not responding immediately. The magazine article took a different course from the one that I'd anticipated, and thus took much longer to write.

After all the research and reminiscence, though, we still aren't much closer to understanding why some old-time telephone engineer named this circuit a "hybrid" . We can only speculate that, before finding his true vocation with Ma Bell, he had failed both English and Genetics.

In the end it seemed more important to concentrate on the defining characteristics of a modern "RF hybrid", which are coupling between some of its ports (usually equal power division), and at the same time, isolation between other ports. Even that is more of a loose consensus than a firm definition, of course.

Anyhow, the article eventually started with a fairly detailed description of the telephone hybrid (which also explains why a hybrid can sometimes be called a bridge instead) and then wandered onward to identify a few RF hybrids and describe some useful applications of RF hybrids; by which point, I had used up my two pages.

Thanks again to everyone who contributed - it certainly helped to straighten out my thinking on what had originally seemed such an innocent little question.

Hello,

I have been looking around the web for a complete kit for an audio amplifier, for a circuit that I am building that needs to have a wide, flat as possible frequency response (0Hz - 100Khz). Need to be able to bring 400mV up to line level. I have seen several kits based on a LM386, but I can't find any specs that show that circuit is reliable beyond 20hz - 20Khz. I am a beginner, so keep that in mind when responding.

But you may be looking for the wrong thing. That's not an audio amplifier,
that's a wideband amplifier. A good op-amp is likely going to be what
you want, because line level is no more than a volt (if even that), so
a gain of about 3 is going to be enough. Of course, if you are driving
something out of the ordinary, that may require something more.

   Andy, you may hate yourself after reading this, but there IS
```

a solution to improving signal-to-noise ratio with a loop:

Mount it HORIZONTALLY. :-)

A loop can be an advantage when it has an electrostatic shield included in it. The pattern will be roughly omnidirectional. With horizontal mounting it won't be high to hit either sail booms or be taken away by wind as easily as a vertically-mounted loop.

In 1967 I proved that to myself with a 60 KHz loop intended for the new WWVB service from (then) NBS (now NIST). 13 x 13 feet in the attic space above my house' center room. Had lots of noisy appliances in the house then, plus harmonics from old tube-type TVs' horizontal sweep (two). Good signal despite all that, just didn't have the good digital hardware to decode it. BTW, a roll of Reynolds' Wrap aluminum foil was sacrificed to make a nice electrostatic shield over #12 AWG electric power wire used for the loop itself.

What I use now is a vertically-mounted loop of #14 wire 2 1/2' in diameter, tuned to 60 KHz. The resonating capacitor for tuning is 10 feet below the loop, using some of 75 Ohm coax capacitance as part of that tuning. Balanced tuning with coax shields together as the center common, aluminum foil as an electrostatic shield connected only to the common. Works well to Fort Collins about a thousand statute miles away.

An "AM BC Band" tuning is easily possible although the number of turns will be reduced (and thus cutting down on developed RF voltage output), but lots of those have been made by others over the years. Mounting the loop horizontally might cause a slight detuning but nothing severe and be roughly omnidirectional so the boat could be in any heading without changing signal strength.

Good luck on that,

LenAnderson@ieee.org

Heh heh heh, the etymological problems can be furthered by looking at other terms in all of electronics and how they came to be known. :-) Sometimes we just have to plain accept common terms rather than buy industrial-strength aspirin quantities to ease the ensuing headaches. "English" (our supposed 'common' language) has, like most other languages in Yurp, grown, adopted, changed, mangled, seasoned, and baked thoroughly by common folk for centuries in daily use. The only "correct" use seems to be that authorized by our school teachers... :-)

How about posting in here when the publishing schedule is firm about which issue the article will appear in? [he said, mangling sentence structure] Might be a fun future topic for discussion? :-)

And for the third time, you still ignore part of the hierarchy.

While the first RFD ignored the hierarchy except for .misc and .policy, and the second RFD added .antennas and .dx, this third RFD long after the discussion started still ignores three of the newsgroups in the hierarchy:
  rec.radio.amateur.boatanchors
  rec.radio.amateur.digital.misc
  rec.radio.amateur.space

In the end, you can't speak for the hierarchy if you don't even know which newsgroups exist in the hierarchy. No wonder you have such disregard for the hierarchy, you only think of yourself as some "administrator" type rather than a participant.

You aren't building bridges, you're imposing your vision on the hierarchy. The fact that you still don't come to the hierarchy and simply talk to us, isntead hiding behind the structure of creating a new newsgroup, says everything about your relationship to newsgroups.

IN the end, I conclude that you like moderated newsgroups because Usenet never sat well with you, and the only way you can deal with it is impose your need for rules on something that is a haven from that.

Ultimately, you are like the problem posters. Neither of you can live without rules, though you need them because you can't tolerate the lack of rules, while they need them because they think the lack of rules is license to do as they please.

You've spent the decade trying to impose rules on the hierarchy, while the rest of us were actually trying to make the hierarchy good by participating in the discussions.

Useless administrators are always trumped by people doing things.

Who's definition of line level? For consumer audio gear, line level
is 0.1 milliwatt into 1000 ohms, or roughly 320mVrms. If your source
impeadance is sufficiently low (most gear has input impeadance in the
several-thousand ohm range), you're done.

If you need it for studio gear, then you've got to get your singal up
to 2.5 milliwatts into 600 ohms, or about 1.2 Vrms, and any of a
million op-amps can give you the gain you need to reach those levels.

The ubiquitous 741 is cheap and easy to use, but the now 40-year-old
design is kinda noisy.

I cannot imagine that a 386 would be a good match just because it's
designed for much lower output impeadance and much MUCH higher levels.

   If you are using TeraWatts of output power (unlikely) or wish
   to detonate a nuclear device (for its EMP or Electro-Magnetic
   Pulse), you are not going to blast anyone's rig or ruin their
   auto boom-box or even harm their ignition from a ready-built
   amateur radio rig.

   As the good "doctor" said, your ham radio test should have
   clued you in on what is considered "harmful" to humans.
   How about reigning in some hysteria and folk tales and
   concentrate on actual building-testing-slinging-solder
   radio-electronics instead of some fantasy notions?  :-(

The trouble is, there just aren't enough words to go around, so innocent little words - "power", for example - are forced to totter under the weight of a dozen different definitions.

Unfortunately the world is full of people who never move beyond the "rules" of grammar and punctuation as taught to little children.

>   How about posting in here when the publishing schedule

The article will definitely appear in the April issue, which goes to print in early March. It won't be possible to post it here, for copyright reasons and because it will be in pdf format, but I will try to send a courtesy copy to everyone who has contributed directly to the discussion.

I would have to say yes, since CW has always been allowed on ALL amateur
bands, from the bottom end to the top end of each.

There are many times when "high" power has disrupted other devices.
The early car computers have been know to shut down with 100 watts of
VHF. Worked on a police car that the engine would shut off when over
80 mph and key the radio.
 A friend would be taking on his 1KW mobile as he pulled into his
driveway. He would find his base radio receiver front end blown. Took
three times to think it through and as he should have been doing,
switch his base antenna (dipole over the driveway) to ground, when not
in use.

FYI - THat is no longer 100% true since the spot frequencies on 60M are
USB only.
And 6 and 2 are the only places with CW only bands.

Isn't that just ordinary RFI/EMI that can happen in a house
environment? :-)

Don't expect auto makers to RFI-proof their wiring without an
extra kilodollar add-in to the sticker price.

Oops, forgot about 60M.  Not sure about 6 and 2 being the only bands
with a CW only portion.  Maybe a better choice of words would be
"non-voice portions" since it appears that the HF bands still have
segments designated for rtty and data. ???

IMHO that was a mistake. It was because the U.S. voice portions of 80m and 40m
where inacessable to ITU zone 1 hams. So putting the data and rtty in them
would have slowed down their growth.

Tune across the high end of the old 80m and 40m CW bands, and you can
see what I mean. from 7100 down, it's almost unusable due to digital
signals, some nights as low as 7050. The same thing with 3850 which is
the top end of my 80m band.

Yes, we now have 7100-7200, but it's not much good for DX yet. It's still
filled with high power SWBC stations who have no intention of moving.
When they are off the air, there is no propigation. :-(

To veer this discussion anywhere near the topic. If you asked because
you are thinking of building a CW only rig, don't worry, it will be
usefull for a long time to come.

Geoff.

In Montana, there was a Sage radar, 5MW pulse power, which would zap
```

your car radio when the beam crossed it. Fortuneatly this was in the 60's before the electronics control of your car's engine. The solution was to tilt the radar antenna up 5 deg. so both the town and the highway that passed in front of it were not impacted. Even so, I have tape recordings from that era which have a little zap in the every 12 secs as the lobes passed through town when the antenna rotated. Oh yes, and before the antenna was tilted, flourescent lights would also blink.

Al

I think you'll get your best help if you ask this on sci.electronics.design, it has a lot more traffic.

I'd definitely use a good op-amp, and definitely NOT an LM386

(single-chip audio power amp, meant to drive a small loudspeaker). The
manufacturer's page here:
http://www.national.com/pf/LM/LM386.html
gives distortion as 0.2 percent, which is pretty bad by modern
standards. The soundcard and a good op-amp will surely give much
better performance.

You said in your original post you want response to DC (0 Hz). All
the soundcards I've heard of are capacitively coupled, and have a
rolloff of around 5 to 10 Hz at the best, and even when this is
removed, the DC performance of such cards isn't guaranteed. It might
be better to use an "industrial" interface card such as made by
National Instruments.

> wave (10m), legal 4w on a 1/4 wave (11m)

About 2 years ago I was in a rather frivolous mood, brought about by a drop of absolute vodka. I wondered just how certain things reacted when put in a 750 Watt microwave oven.

I first tried a new way of burning a CD. Amid sparks and a pyrotechnic display that appealed to my sense of pissedness, it sort of got crazy-paved. After about 20 seconds I had to switch off the microwave because of the stench.

Then I turned to more "electronic" things. A Fujian MP3 player bit the dust instantly. Basically there was one huge "woooooffff!", then the PCB set fire to the plastic case after about 30 seconds.

Then I tried an old hamradio rig. It was an old Trio (Kenwood in the USA) 2200GX, crystal-controlled rig, with a rubber-duck antenna, and a battery compartment that had not held batteries for several years. I put it in as it was, but without the mic. Battery door open, rubber-ducky antenna on.

It sat there for about 15 seconds before anything happened, then the front panel sparked a bit and caught fire. The front panel looked similar to the CD, but a bit more melted-down, and the knobs had changed to a totally new shape. But apart from that, the radio itself still worked fine after a 30 second 750W cook. It just looked more of a mess then it did originally.

Out of interest I tested it. I was expecting RF to get in the antenna and coarse its way through the PCB, but no! The RF sensitivity was 1.25uV PD for 20dB sinad. Perhaps that was 10dB down, but it was still quite useable The TX was still delivering 1.5 Watts.

I took off the case and tried again, and THAT killed it for sure. After only 10 seconds the PCB "whooffed", with loads of sparks and spitting.

But the point is that you cannot couple more power into a rig than that, even with the cover on. The antenna was connected, and 750 W did not kill it instantly, as expected. These rigs are far more resilient than one would imagine.

> than a couple of bucks.

BG Micro has the metal ones, that you tend to use in the final, for a quarter, the plastic ones you use for anything else for 6 cents. They have surface mount MMBT2222A's for 4 cents.

2N2222's are handy little transistors that show up everywhere, and any time you need any old NPN, a 2N2222 will generally do, so it never hurts to have a few hundred in the parts drawer. And at $6/100, it doesn't hurt the wallet all that bad, either.

Of course, BG shipping to merrie auld England probably isn't all that pretty, but Farnell or some other local supplier must have something comparable. I'm sure there must be a BC equivalent ... I bet if you found the cheapest NPN it would be the same thing. You might shoot off a note to George or Ian, or perhaps take a peek at the G-QRP's Circuit Handbook. They seem to love the daylights out of the BC108, so I bet it is comparable (although I don't have any data on that to compare).

HP,

The whole point of my original post was to see if forming a micropower net on 80M COULD be done within the rules.   I would indeed be a poor mentor
for encouraging students to break the rules... and I never advocated such. Please speed-read what I post a little slower next time :)

Today I make my first presentation, and I have a pretty bad cold. I don't have any Mr. Wizard exhibits put togther, just the equivalent of a slide show plus a few parts, because I only have a week's notice.

I am changing tack and taking my radio with me to the classroom, if the students are really interested I will lend the classroom my rig until a replacement can be build or bought, and be with them for a couple hours per week as control operator. The science teacher has promised it could be connected outside to a wire antenna of some type if at all possible.

So wish me luck, and please use my handle on Usenet rather than my name from now on. I'd rather not be made by some determined lunatic intent on causing me or my family any harm.

>
> Since there are both physical laws of nature and interference (natural and man-made) to contend with, the real magic in radio is the antenna, amplifier(s), filter(s), and operator techniques used to extract useful information from a feeble signal. (Case in point: Voyager 1 is now more than 9 BILLION miles from earth, but as long as its flea-power transmitter holds out, we expect to be able to continue receiving data.)
>
> There is great fun in building simple receivers, and much to be learned. A few years back, for lack of something better to do one evening, I knocked together a regenerative set on the bench top in the garage. I wound a coil on a toilet paper tube, made a grid-leak capacitor out of a couple of microscope slides and some foil, and hooked up an old #26 tetrode. The rig was "wired" with alligator leads and powered by flashlight batteries. The antenna was 15 feet of wire thumb tacked to the garage ceiling, and the ground was a 'gator clip attached to the cover plate screw of a nearby outlet. A few adjustments later and I found myself listening to a radio-theater presentation of "Dracula" put on by the BBC in London. That's more than 5000 miles from where I live. That's magic.
>
> In your case, a FET based regenerative set would be the ticket. Dirt cheap and effective enough to be useful. (I'm thinking something along the lines of 1 FET RF/isolation, 1 FET regen stage, and an LM386 amp

Well, I did try to build a regenerative receiver to demonstrate to the
class,
but I couldn't get regeneration. Shall I mail it to you to see if you
can debug it?

Thanks,

The Eternal Squire

Point taken, and I beg your pardon. However, I still try to err on
the side
of caution than the other way.

The Eternal Squire

Not cheap, but the horse's mouth is:

  http://www.bwantennas.com/coils/aduxacr.htm

I have been getting glass-epoxy or phenolic tubes (good place: www.mcmaster.com
) and winding mine from rod/wire lately (silver plated in some
cases... learning how to silver plate myself too!).

Tim.

Hi Ian,

A hybrid coil in telephony was (is?) used to couple a 2 wire line to a 4 wire line allowing bidirectional amplification. If you have access to Reg's old bible _Communication Engineering_ by William Everitt you can read an explanation of how this works starting on page 317 (second edition).I suppose the term "hybrid" refers to the fact that two different types of line (2 wire and 4 wire) are involved.

From _Microwave Engineering Using Microstrip Circuits_ by Fooks and Zakarevicius: "Hybrid couplers may be regarded as directional couplers which can produce an equal power split between the output ports. This definition is good in the main, but it is possible to have hybrids with unequal power split. Inherently, a hybrid and a directional coupler are the same type of device. The only difference is really one of construction, with the hybrid-line coupler historically arising out of structures which aimed to produce equal power splitting with good isolation, directional coupling aspects not being of interest."

73,
Tom Donaly, KA6RUH

Looks like I have a reprieve. Today is considered a half day for student due to snow, so my presentation got cancelled. Which is a good thing too, cause I'm quite unprepared for it.

Being the only Extra, let alone ham, in the area is a very overwhelming feeling.

This whole thing needs to be rethought anyway. If anyone has bits and pieces of working homebrew I can borrow, say yes here and I will contact you privately.   My own homebrew is just not working today worth a darn.

Hi Brian .... I think I've seen that call on QRP-L or maybe the Microchip forum.

If you're willing to ship to mister35mm and you got 'em for $6/100, $1/5 in the TO18, that's pretty darn hard to beat

..

Hi Ian,

Hybrid in biological terms I believe means that it can not reproduce
itself. Plants from Hybrid seeds can only be grown from the original
seeds.
I would guess that the relationship to the hybrid coil would have to
do with the isolation between ports,,, can't be reproduced from port
to port only from the original or single port.

Squire,

With all due respect, you need to re-read *my* post. I never accused you of anything. Rather, I indicated up front that my comments were directed both to you and to others in this thread, some of whom have advocated an "it is easier to get forgiveness than permission" point of view. I think you've agreed that this is not appropriate for a mentor/teacher/role-model.

Squire-

I'm going to take your comment on face value and assume that your receiver is indeed functional but for lack of proper regeneration. If this is the case, I would guess that the most common cause of this kind of problem is improper phasing of your tuning/ticker coils.

It would help if you could post or point to a schematic from which you worked, but let me suggest this. Lift both leads from you tickler winding and then swap them. This may be all it takes to fix the problem.

BTW: Check out this simple receiver by Charles, N1TEV. It follows, more or less, the architecture I proposed, and apparently works well. PCBs are available.

http://www.electronics-tutorials.com/receivers/regen-radio-receiver.htm

Here is a simpler circuit by regenerative radio guru C. F. Rocky.

The problem with APRSPoint is not the operating system. The problem is that the author and seller of the program does little to enhance the program. It does not meet the APRS spec and lacks functionality that is much needed to make this a full functioning APRS program. The author also sponsors a "support" group on Yahoo Groups. The problem with him and the group is that if you say anything critical of the program the author censors the post so no one else will get a bad impression - or should I say honest impression of the APRSPoint program. Be advised, until he starts fixing and

enhancing the program and accepts honest feedback in his forum, stay away
from this program. You can use AGWTracker, Xastir, WinAPRS and UI-View.

The data sheet hints at DC to 58MHz, interesting little chip with Gilbert cell AGC and differential inputs and outputs that can also be used in single ended configuration.

Since I started scrapping old F/H 5-1/4 hard drives that were laying about and forgotten I've found that some of these use this chip, I've liberated a few so far.

...

>Hi Ian,

> A hybrid coil in telephony was (is?) used to couple a 2 wire line to a 4 wire line allowing bidirectional amplification. If you have access to Reg's old bible _Communication Engineering_ by William Everitt you can read an explanation of how this works starting on page 317 (second edition).I suppose the term "hybrid" refers to the fact that two different types of line (2 wire and 4 wire) are involved.

Hello Ian and Tom,

The mention of "Communication Engineering" by William Littell Everitt sparked my interest since it has prime occupancy on my Basics bookshelf space (the book and I were "born" in the same year...:-)

Going into the etymology of *ALL* "hybrids" in communications will probably focus not on "radio" but the common telephone handset and the long-distance, wired telephone system courtesy of remarkable innovation by the American Telephone and Telegraph laboratories. Note: I'm not waving a flag for "Americanism" only that the AT&T system grew to be huge early-on and also engineered for rather incredible longevity and good performance.

The common telephone set made here by the MILLIONs between the 1930s and 1970s period all had a "hybrid transformer" as its basic "coupler" to the telephone line, here a 2-wire balanced-pair to the central office. Mouthpiece and earpiece were actually isolated by this "hybrid" with a controlled leak-through to the earpiece for "sidetone" (a term that came from telephony as well). In addition, the "hybrid" coupled or isolated the 40 VDC (give or take) always present on our telephone lines and the 20 Hz Ring signal (with/without the hook switch cut-out). Added to that were a (somewhat) primitive "ALC" using thermistors-varistors to keep loud talkers from blasting ears of other users. Rather complex arrangement but very simple in terms of parts, rugged, long-lasting (better than 30 years life), and cost effective.

It would seem that the POTS hybrid scheme grew out of long-distance lines' repeater stations where two amplifiers were needed to boost signal strength both ways...AND provide a DC path for lots of different telco service needs. The concept of linearity through negative feedback was a direct result of "long-lines" repeater needs. A long-lines repeater "hybrid" seems to have evolved from the already-existing bridge circuit used for measurement of passive components. I say "seems" because both repeater hybrid and measurement bridges are configured for balance and "separation" of the components' characteristics. All of that took place at "audio" frequencies (under 15 KHz), including frequency-multiplexed SSB voice channels. Yes, "SSB" was pioneered by the various telephone companies in the world, on wire lines first, then on "radio." :-)

Segue to World War II and some massive head-scratching on both sides. "Radio" folks of older days may have encountered a "Magic-T" in waveguide, particularly at X-Band (3 cm or 8 to 12 GHz). A Magic-T is really a hybrid transformer equivalent, RF energy coming into a common port (inbound) is relatively isolated from RF energy into a 3rd port intended to go outbound. The fourth port is generally terminated in a resistive load for broadband balance but can also be used as a bidirectional port. "Isolation" is a result of good directional balance, a term that became common in the microwave field after WW2 and Isolators and Circulators came into being. Note: A "circulator" performs the same function as the old Magic-T but has a greater production yield, generally more compact.

The "rat-race hybrid" of all-coaxial lines probably evolved out of the Magic-T as a semi-broadband hybrid transformer but at RF lower than microwaves. It had limited use until Stripline and Microstrip was innovated. Most Rat-Races are still rather narrowband and incapable of working to octave bandwidths common to microwaves. With Stripline a whole vast array of "flat" configurations were innovated but all based on basic transmission line properties...including all the filter structures built entirely on PCBs.

Broad-banding at RF also had to wait for better powdered-iron and ferrite materials' better characteristics that came about after WW2. One offshoot of that was the broadband RF transformer that could have double decade bandwidth. Such RF transformers could be configured very much like the old POTS hybrid transformers. :-) Variants of those appeared in HF through UHF solid-state power amplifiers and "hot plug swapping" RF power amplifiers composed of many modules, each relatively isolated from one another. Does anyone working at RF not know about the "balun?" [broadband impedance-changing/isolating transformer]

It is my opinion that many, many terms became a sort of jargon or "tech-speak" for the simple reason of the names being short yet familiar to all working with a particular field. For example, it is much easier to say and pronounce "flip-flop" than the formal name of "Eccles-Jordan Bistable Multivibrator." :-) Folks in radio say "mike" for microphone or for microfarads of capacitance; what they are talking about does a subtle unconscious separation and ordering of the incoming information. There isn't much confusion about such jargon even if discussing 'condenser microphones.' :-)

Sometimes the jargon becomes over-used. I use the term "Wilkinson Power Divider" [or "Power Splitter"] for a familiar Stripline structure, yet I've heard and seen it described as a "Wilkinson Hybrid." While it is on the grey area of veddy proper useage, most RF folks know what either is. Editors writing for a large, unknown-technical-smarts-set readership do, understandably, get a bit under stress trying to Explain It All. [been there, done that, got a few T-shirts...:-)]

I would trace "hybrid" in electronics all the way back to the guy that invented the "Wheatstone Bridge." Wheatstone spoke and wrote about that clever thing so much that His name got stuck on the configuration, the real inventor's name got rather lost. Balance and isolation were essential there...and balance and isolation was necessary in the telephone "hybrid." Millions of telephone "hybrids" later, the jargon happened. The "hybrid" essential principles were applied to other fields within electronics and the rest is slightly confused history...:-)

Cheers,
LenAnderson@ieee.org

MC1350s are still being produced (!) and can be bought
from Jameco...www.jameco.com...$1.95 each, $1.85
quantities of 10. Jameco's catalog 271 has them as
"audio amplifiers"   :-)

Those are the plastic-packaged offspring of the original
Motorola MC1590, intended for any sort of RF amplifier-
with-DC-gain-control from low AF on up to 70, 80 MHz.
Differential input, differential output, gain control to
beyond 50 db, very good constant input impedance on
each input side. Open-collector on output so there is
good flexibility in its load configuration. Turns out they
also make good limiters.

Quick, simple question:

Would a normal aluminum can be any good for RF shielding of a balun, or would it for some reason not work? Should I connect it to ground?

And;
What does a transmatch do for me that a normal balun/transformer won't do

for me?

Thank you for your time.
Sincerecly,
--

Thank you, but most of the thanks should go to a
gentleman at the Signal School that was in Fort
Monmouth, NJ, back in 1952. He had spent a lot

of his work time at Bell Labs. My MOS was Microwave Radio Relay in the Army and had to encompass comms techniques from landline telephone through radio at VHF to microwaves. Even more to a couple of GE technical reps who oversaw the installation of 24-voice-channel 1.8 GHz radio relay terminals in Japan '54 to '56. They had the knowledge at their mind's finger-tips and infused a number of us back then with some indelible information. :-)

If you wish to see a bit more of 50-year-old military communications, download:

http://sujan.hallikainen.org/BroadcastHistory/uploads/My3Years.pdf

It's about 6 MB and takes about 20 minutes on a dial-up connection. Hal has a lot of information collected there, not all of it on broadcasting.

There was also the MC1351 which was a 'hotter'chip with more gain.

Well IF cans are made of aluminum so I would think a can would work
fine.  Normally one should keep the walls of the can some minimal
distance from the coil windings. IIRC the radius of the can should be
something like 2-3 times the dia. of the coil.

OK OK boys... yes I know 2n2222's are wonderful and plentiful, but I have a heap of geriatric bipolar power transistor I thought it might be worth experimenting with:-

2n3055 (three)

2n3054 (four)

2n3739 (two)

2n4800 (one)

Sony D292 U38 (two)

Sony 2sc895 (one)

I thought if you can get anything up to 500mW with a general purpose NPN, then what can you get out of an old power transistor?

I also have a load of BD139 medium-power transistors...?

Any thoughts?

In addition, I am still looking for the COMPONENT LAYOUT for the PCB for a QRP transmitter called "little joe" described in 9-81 in QST. I am not looking for just the circuit diagram but where the parts GO on the PCB!

Stephen G7VFY

I believe that I've read that the distance from metallic objects
should, at a bare minimum, be at least 1/2 the coil diameter. So that
means 2 times minimum, giving 1/2 of coil diameter around the sides.
3 would be much better. Aluminum is good shielding material; onlt
thing better would be copper (or silver).

I have a few of these radios; I'm wanting to put together some battery packs for them. Does anyone have a good schematic for a DC-DC converter to take 9vdc to 90vdc?
I'm also going to need to make up a 4-prong connector for the battery packs; any ideas anyone? Can the connectors be purchased? Thanks a lot

As is so often the case with word/phrase etymology, origins are sometimes cloudy. The wikipedia article alludes to this. But I believe the key is that the two outputs are equal in a so-called "hybrid". You might simply tell your readers in summary that the issue is unclear, and that you gave it the best shot anyone reasonably can.

Guess I came up with a rather cheap alternative then. :D

Think newspaper, or any other kind of paper, would be good filling material to isolate the transformer from the aluminum can?

There are two things to keep in mind when you put a coil in a can.

1. The inductance will decrease due to the reduced voulme for the magnetic energy. This is the same effect as using a brass slug to change teh inductance of a coil for VHF applications.
2. The losses will increase due to the induced currents in the walls of the container.

The further away the walls are the lower the effect. The various rules of thumb you hear are just the result of someone determining what is acceptable.

What happens is that the metal acts as a shorted turn which absorbs some
of the current flowing in the inductor. A brass slug core inside the
coil takes advantage of this, the closer to the center of the coil the
greater the effect. The result is both a lowering of the inductance and
probably the Q. An effective way to tune vhf-uhf circuits, but a
shorted rotary turn was also used on the hf bands in "olden" days.
In the case of small tightly wound inductors with iron core slugs
the coupling from the shield can to the coil is rather small (ratio of

```
the turns and inductance) so the effect is small.

Ah, so if there's lots of noise where I put my transformer I'm better off taking a small hit to signal strength to still improve my s/n ratio, but if there's little noise I'd just be canceling out the weakest signals... Guess I'll have to try it with and without the can then to see if I've got lots of noise here. :)

Thanks for the reply.

a cheap ready-made lofer coil is right in an old junker tv..the horizontal
output coil usually has a ferrite adjustment for frequency (horizontal
hold)... put another one in series with your 50 foot antenna, and tune that
as your load for increased output. I bet you can even use one for a cheapie
regen radio down there too...Hmmm time to visit the dump..
....

Who besides Watkins Johnson used SMC jumpers? I need to find three
connectorized jumpers for my WJ 8718.
tnx

Tks TErry for your reply, but no is SP41, is 3P41, a Japan Transmision tube,
made by JRC (Japan radio compay).- The data shett5s is in nippon (japanese)
language, wich Unknown for me.-
Still hope help.
Excusme my english poor.
Regards

Heriberto

The problem with power transistors is that they are big, and all other things being equal, more size spells more capacitance, and mosr capacitance spells more trouble at higher frequencies.

Chances are, you might do some good with some of them on 80, but you're not likely to make them play nice on 20. If you notice, the 3055 has an Ft of 2.5 MHz, 3054 3 MHz. The 2N2222 has an Ft of 250 MHz, so you can see there's a little difference there.

Your 3739 has a 10 MHz Ft, so you might get a little gain out of it on 80.

The 2SC895 I *think* is 20 (could only find a bad copy of the datasheet).
It will take a fair bit of tinkering to make parts like that work at all,
and they won't work well.

..

...and the MC1349. But, Lansdale bought the rights and
production "rubyliths" to the 1350 and either ON Semi
or Freescale (the splits of old Motorola Semi) indicate
they are still production items.

The 1590-1350 and variants are output-open-collector,
therefore their individual stage gain is a function of the
load impedance. You can get an easy, stable, wide-
band gain of 30 db plus, all the way out to 60 MHz.
Input impedance is a constant 5 K in parallel with 5
pFd each input, easy to deal with since it isn't that
sensitive to output loads.

I did; didn't go so good.  I thought I'd try here, since bein' what
I'm proposing to make is a homebrew, so is somewhat relevant to the
forum.  Oh well, Guess I'll go hang out at the Yahoo groups for a
while; yahoo is my ISP anyway.

>The 2SC895 I *think* is 20 (could only find a bad copy of the datasheet).
>It will take a fair bit of tinkering to make parts like that work at all,
>and they won't work well.

The current gain drops to unity at fT, but you might still get some voltage and power gain around such frequencies in a common base configuration. This is the case in many microwave bipolar amplifiers, since you can not get transistors (or would be too expensive) with fT sufficiently high for common emitter configurations on a particular band.

However, I have not seen common base amplifiers for HF, since RF power transistors with sufficiently high fT are easily available for HF.

It had a blown M9D mixer which I replaced with a MCL TAK-3H and now it works pretty well except that I get all kinds of images because the low-pass RF filter A2 is missing, part No. 791616. Anyone know where I might find an exact or equivalent replacement? I also need 3 jumpers with SMC threaded plugs on each end, or some plugs.
tnx

Pasternack has the plugs, although they are sadly not cheap.  I got a TMC
receiver a couple years ago that had been demilitarized with a boltcutter
and wound up having to buy a bunch from them.

Ok then.... I give up.

I had checked out the maximum frequency on all these old bipolar power trannies, and basically, I've stuck them on ebay.

I seem to have quite a few BD139 power transistors. They are not as 'meaty' looking as they are medium power, plastic cased and are not small signal types.

Looking at the data sheet here:- http://www.ortodoxism.ro/datasheets2/6/0rwiehk82adehe25p4gkxjros2yy.pdf

It say these transistors are good up to 190MHz, so does this mean I can use one instead of a 2n2222 (I have lots of these BD139's and if they'll work, I'd like to try)

Would I have to change any of the component values of the Michigan Mighty Mite (http://cs.okanagan.bc.ca/ve7ouc/eng/kc6wdk-mirror/transmitter.html) component values to use a BD139? Say 1/2 or 1 watt resistors?

Mostly the receivers are direct conversion or low-IF (hundreds of kHz) these days, and the IF filters are active R-C filters on chip (then come the ADCs, followed by a DSP channel filter).

If you find a phone which was built 3 or more years ago then you will probably find a couple of quite high performance (good phase noise) Voltage Controlled Oscillators on little PCBs in metal cans. These could be re-used if the frequency is right for what you need (one will be in the transmit band of the phone normally, and the other one might be at a strange frequency). In phones from the last couple of years, those VCOs are all on-chip.

In GSM phones more than a year old, there will very likely be a good quality Temperature Compensated Voltage Controlled crystal Oscillator (TC-VCXO) at either 13 or 26 MHz, and those have much better phase noise and tempco than typical crystal oscillators in cans that you would get out of most other consumer products. The control voltage provides an easy way to adjust it (over a few PPM range only, e.g. calibrate it to a received frequency standard, which is what the phone does). Now in new phones they are starting to use on-chip oscillators with a separate crystal that would be less useful to homebrewers as it is not inherently temperature-compensated without the phone's software. It would still be a good crystal though, and in many cases the specifications can be found for the crystal.

The PA is normally still a separate component, so if you want a watt or so of RF then that component could quite likely be reused though they are fairly narrow-band if you want the full performance.

Other things you might find are LNA chips and SAW filters (e.g. in 3G phones you would find one at the Tx frequency and another at the RX frequency, in Europe this is a 60 MHz bandwidth centred at 1950MHz or 2140MHz. This might be useful as a first IF in some kind of up-converting architecture like a spectrum analyser.

I have also seen some websites where they have figured out how to drive the colour LCD panels out of recent phones for microcontroller projects.

Chris

Hi there: Heriberto.
Japanese unknown to me also!
I have tried searching Google with different combinations of words but
no result.
You probably searched also.
Maybe someone in/araound Japan can help?????
Try a 'boat-anchors' radio group????
Warm regards from Canada where it has been snowing!
Terry.

1=2E Einleitung

Diese Beschreibung der Selbstbau KW-Linearendstufe soll diejenige Gruppe der Funkamateure ansprechen, die immer noch mit gro=DFem Interesse verschiedene Ger=E4te und Teile Ihrer Funkanlage mit zum Teil bescheidenen Mitteln selbst bauen.Das dazu eine Menge theoretischer und praktischer Erfahrungen, auf dem Gebiet der Elektronik und HF-Technik erforderlich sind, ist fast selbstverst=E4ndlich. Aber auch Funkamateure, die sich bisher noch nicht so intensiv mit dem Selbstbau verschiedener Ger=E4te befa=DFt haben kann diese Baubeschreibung viele praktische Tips und Hinweise liefern. Da die beschriebene KW-Linearendetufe nur von lizenzierten Funkamateuren mit der Lizenzklasse B betrieben werden darf, soll hier vollst=E4ndigkeitshalber nochmal erw=E4hnt werden.

2=2E Ausgangsbasis f=FCr den Selbstbau einer Kurzwelle

Die Ausgangsbasis f=FCr den Selbstbau dieser KW-Linearendstufe war einerseits das gro=DFe Interesse am Selbstbau und andererseits die M=F6glichkeit eines Nachbaues dieser Endstufe zu schaffen.Da die Kaufpreise von neuwertigen KW-Linearendstufen verschiedener Hersteller meist =FCber 2500 DM (verschiedene auch weitaus h=F6her) liegen und die Einzelpreise der Austausch- oder Ersatzr=F6hren bis zu DM 500,-/Stck. betragen, kommt auch noch ein finanzieller Aspekt hinzu. F=FCr diese Endstufe sind fast s=E4mtliche verwendete Bauteile (sofern nicht in sogenannten Funkbastelkisten vorhanden) mit Ausnahme der beiden Sendetrioden T 380-1, sehr kosteng=FCnstig auf den von Funkamateuren organisierten Flohm=E4rkten erworben werden. Der gesamte Aurbeitsaufwand ist, je nach pers=F6nlicher Begabung des einzelnen und nach Ausstattung der Endstufe, mit etwa 150 - 250 Std. anzusetzen.

Bei der Wahl der Sender=F6hren und der Ausgangsleistung der Endstufe wurde der neuen DV-AFuG vom 11.12.1981, wonach in Lizenzklasse B die Spitzenausgangsleistung 750 Watt (und wobei die Summe der Anodenverlustleistungen 750 W betragen kann) nicht =FCberschritten werden darf, Rechnung getragen. Die hier konzipierte Endstufe arbeitet mit 2 parallel betriebenen Sendetrioden des Typs T 380-1 von ABB in der Gitterbasisschaltung und erreicht eine Ausgangsleistung von 750

Watt in allen Betriebsarten und auf allen B=E4ndern bei einer Ansteuerung von 80 - 100 Watt. Da die Gesamtanodenverlustleistung der beiden R=F6hren 760 Watt betr=E4gt, lassen sich diese im AB-1 Betrieb schonend fahren, was den Intermodulationsabstand erh=F6ht und sich positiv auf die Lebensdauer der R=F6hren auswirkt. Ein weiterer Vorteil ist die Nutzung der Ausgangsleistung von 750 Watt in allen Betriebsarten und auf allen B=E4ndern, was auf die enormen Leistungsreserven der R=F6hren zur=FCckzuf=FChren ist.

Die beschriebene Endstufe mu=DF vom mechanischen und elektrischen Aufbau sowie deren Ausstattung nicht unbedingt bindend oder als optimal angesehen werden. Hier sind sicherlich eine Reihe von =C4nderungsm=F6glichkeiten denkbar. Dies aber bleibt letztlich jedem Funkamateur, seiner Phantasie und seiner Kreativit=E4t =FCberlassen. Diese Beschreibung kann nur die n=F6tigen Denkanst=F6=DFe dazu liefern.

3=2E Mechanischer Aufbau

Durch den gro=DFen Platzbedarf und das enorme Gewicht der vorhandenen Transformatoren wurde das Netzger=E4t in einem getrennten Stahlblechgeh=E4use untergebracht. Das Geh=E4use der Endstufe war aus verschiedenen 2 mm starken Aluminiumplatten zusammengeschraubt worden und hatte etwa die Abmessungen 380*320*280 mm.

Es leider nicht m=F6glich, die seinerzeitigen Ansichtsfotos hier abzubilden.

Alle Netzteilbauteile wurden auf einer kr=E4ftigen 3 mm starken Stahlblechmontagetafel aufgebaut, welche dann mit dem Geh=E4useboden verschraubt sind. Die notwendigen Bedienungselemente sind in die Frontplatte eingebracht und diverse Anschlu=DFkabel mit Knickschutzt=FCllen nach hinten herausgef=FChrt. F=FCr die.elektrischen Verdrahtungen wurden im Netzteil entsprechende L=F6tleisten aufgebaut. Das gesamte Geh=E4use ist mit einem U-f=F6rmigen Deckel verschlie=DFbar.

Das Alugeh=E4use der Endstufe war durch ein Zwischenblech so aufgeteilt worden, da=DF im unteren 100 mm hohen Teil der gesamte HF-Eingangsteil sowie die Steuerung, und im 180 mm hohen oberen Teil der gesamte HF-Leistungsteil untergebracht war.

Im oberen Teil sind folgende Bauteile plaziert : Plate- und Loaddrehkondensatoren, Bandwahlschalter, Auskoppelkondensatoren, Keramikrippenk=F6rper, Luf'tspule L 10, Anodendrossel und die beiden Sender=F6hren. F=FCr ausreichende Luftk=FChlung sorgt hier ein Ventilator mit 160 m3/h und eine entsprechende str=F6mungsg=FCnstige Luftf=FChrung.

Im unteren Teil der Endstufe sind die Bauteile : Steuerungselemente, Verdrahtung, L=F6tleisten, Steckerzuf=FChrung, Hochspannungsanschlu=DF, R=F6hrenfassungsanschl=FCsse, HF-Eingangsteil mit Bahnwahlschalter, Antennenanschl=FCsse, Antennenrelais sowie die Katodendrossel zu finden.
